# **A** Product Descriptions

| Classification Table of the LM Guides   1-8                | Models SSR-XV and SSR-XVM                                                         |
|------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Point of Selection \alpha1-10                              | Standard Length and Maximum Length of the LM Rail . A 1-116                       |
| Flowchart for Selecting an LM Guide A1-10                  | Tapped-hole LM Rail Type of Model SSR A1-117                                      |
| Setting Conditions                                         |                                                                                   |
| Conditions of the LM Guide                                 | Caged Ball LM Guide Ultra-heavy Load Type for Machine Tools Model SVR/SVS 🖪 1-118 |
| Selecting a Type                                           | Structure and Features                                                            |
| • Types of LM Guides                                       | Types and Features                                                                |
| Calculating the Applied Load                               | 71                                                                                |
| Calculating an Applied Load                                | Dimensional Drawing, Dimensional Table                                            |
| Calculating the Equivalent Load                            | Models SVR-R and SVR-LR                                                           |
| Rated Load of an LM Guide in Each Direction A1-57          | Models SVS-R and SVS-LR A1-126                                                    |
| Calculating the Static Safety Factor 41-61                 | Models SVR-C and SVR-LC 🔼1-128                                                    |
| Calculating the Average Load                               | Models SVS-C and SVS-LC                                                           |
| Calculating the Nominal Life                               | Models SVR-RH (Build to Order), SVR-LRH (Build to Order),                         |
| Nominal Life Equation for an LM Guide Using Balls A1-64    | SVS-RH (Build to Order), and SVS-LRH (Build to Order) 🔼 1-132                     |
| Nominal Life Equation for the Oil-Free LM Guide A1-64      | Models SVR-CH (Build to Order), SVR-LCH (Build to Order),                         |
| Nominal Life Equation for an LM Guide Using Rollers A 1-65 | SVS-CH (Build to Order), and SVS-LCH (Build to Order) 🔼 1-134                     |
| Predicting the Rigidity                                    | Standard Length and Maximum Length of the LM Rail A1-136                          |
| • Selecting a Radial Clearance (Preload) A1-68             | otaliaa 20. gir ala mamian 201gir or ilo 21. Tairi 🔤 1. 700                       |
| Service Life with a Preload Considered A1-69               | Caged Ball LM Guide Wide Rail Model SHW   1-138                                   |
| • Rigidity                                                 | Structure and Features                                                            |
| Radial Clearance Standard for Each Model A1-70             | Types and Features                                                                |
| Determining the Accuracy                                   | Typoc and readings minimum <b>=</b> 1 110                                         |
| Accuracy Standards                                         | Dimensional Drawing, Dimensional Table                                            |
| Guidelines for Accuracy Grades by Machine Type 🔼 1-75      | Model SHW-CA                                                                      |
| Accuracy Standard for Each Model                           | Models SHW-CR and SHW-HR 1-144                                                    |
|                                                            | Standard Length and Maximum Length of the LM Rail A1-146                          |
| Features and Dimensions of Each Model 41-87                | • Greasing Hole                                                                   |

## Classification Table of the LM Guides

#### **Features and Types**

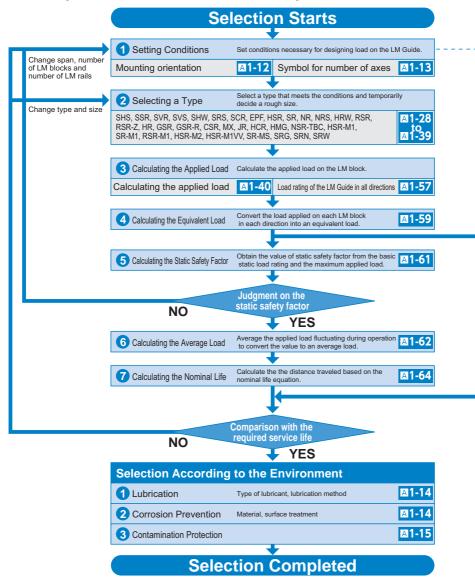

Classification Table of the LM Guides

# Flowchart for Selecting an LM Guide

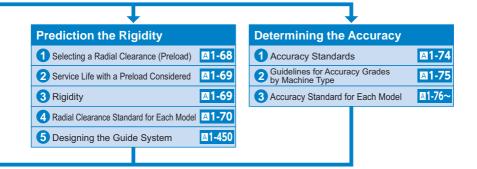

[Steps for Selecting an LM Guide]

The following flowchart can be used as reference for selecting an LM Guide.

#### Flowchart for Selecting an LM Guide

- · Space in the guide section
- Dimensions (span, number of LM blocks, number of LM rails, thrust)
- Installation direction (horizontal, vertical, slant mount, wall mount, suspended)
- · Magnitude, direction and position of the working load
- · Operating frequency (duty cycle)
- · Speed (acceleration)
- · Stroke length
- · Required service life
- Precision of motion
- Environment
- In a special environment (vacuum, clean room, high temperature, environment exposed to contaminated environment, etc.), it is necessary to take into account material, surface treatment, lubrication and contamination protection.

# **Setting Conditions**

### Conditions of the LM Guide

#### [Mounting Orientation]

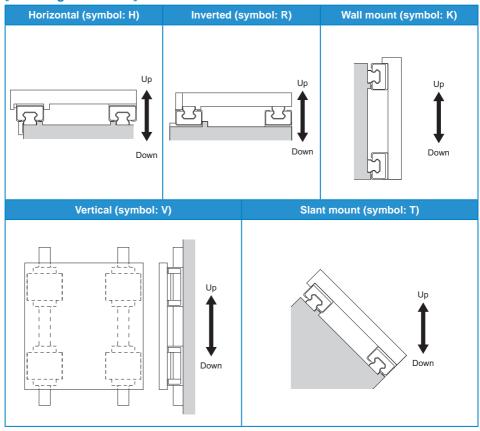

The LM Guide can be mounted in the following five orientations.

If the mounting orientation of the LM Guide is other than horizontal use, the lubricant may not reach the raceway completely.

Be sure to let THK know the mounting orientation and the exact position in each LM block where the grease nipple or the piping joint should be attached.

For the lubrication, see **A24-2**.

### [Mounting Orientation]

**Setting Conditions** 

#### [Symbol for Number of Axes]

If two or more units of the LM Guide are parallelly used in combination on the same plane, specify the number of the LM rails (symbol for number of axes) used in combination in advance. (For accuracy standards and radial clearance standards, see **A1-76** and **A1-70**, respectively.)

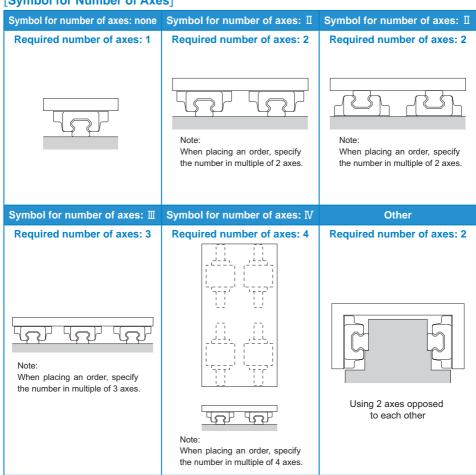

#### Model number coding

# SHS25C2SSCO+1000LP - I

Model number (details are given on the corresponding page of the model)

Symbol for number of axes
("II" indicates 2 axes. No symbol for a single axis)

### [Symbol for Number of Axes]

#### [Service environment]

#### Lubrication

When using an LM system, it is necessary to provide effective lubrication. Without lubrication, the rolling elements or the raceway may be worn faster and the service life may be shortened.

A lubricant has effects such as the following.

- (1) Minimizes friction in moving elements to prevent seizure and reduce wear.
- (2) Forms an oil film on the raceway to decrease stress acting on the surface and extend rolling fatigue life.
- (3) Covers the metal surface to prevent rust formation.

To fully bring out the LM Guide's functions, it is necessary to provide lubrication according to the conditions.

If the mounting orientation is other than horizontal use, the lubricant may not reach the raceway completely.

Be sure to let THK know the mounting orientation and the exact position in each LM block where the grease nipple or the piping joint should be attached. For the mounting orientations of LM Guides, see **A1-12**. For the lubrication, see **A24-2**.

Even with an LM Guide with seals, the internal lubricant gradually seeps out during operation. Therefore, the system needs to be lubricated at an appropriate interval according to the service conditions

#### Corrosion Prevention

#### **■**Determining a Material

Any LM system requires a material that meets the environments. For use in environments where corrosion resistance is required, some LM system models can use martensite stainless steel.

(Martensite stainless steel can be used for LM Guide models SSR, SHW, SRS, HSR, SR, HRW, RSR, RSR-Z and HR.)

The HSR series includes HSR-M2, a highly corrosion resistant LM Guide using austenite stainless steel, which has high anti-corrosive effect. For details, see **A1-390**.

#### **■Surface Treatment**

The surfaces of the rails and shafts of LM systems can be treated for anti-corrosive or aesthetic purposes.

THK offers THK-AP treatment, which is the optimum surface treatment for LM systems.

There are roughly three types of THK-AP treatment: AP-HC, AP-C and AP-CF. (See **B0-20**.)

**Setting Conditions** 

#### Contamination Protection

When foreign material enters an LM system, it will cause abnormal wear or shorten the service life, and it is necessary to prevent foreign material from entering the system. When entrance of foreign material is predicted, it is important to select an effective sealing device or dust-control device that meets the environment conditions.

THK offers contamination protection accessories for LM Guides by model number, such as end seals made of special synthetic rubber with high wear resistance, and side seals and inner seals for further increasing dust-prevention effect.

In addition, for locations with adverse environment, Laminated Contact Scraper LaCS and dedicated bellows are available by model number. Also, THK offers dedicated caps for LM rail mounting holes, designed to prevent cutting chips from entering the LM rail mounting holes.

When it is required to provide contamination protection for a Ball Screw in an environment exposed to cutting chips and moisture, we recommend using a telescopic cover that protects the whole system or a large bellows.

For the options, see **A1-478**.

#### [Special environments]

## Clean Room

In a clean environment generation of dust from the LM system has to be reduced and anti-rust oil cannot be used. Therefore, it is necessary to increase the corrosion resistance of the LM system. In addition, depending on the level of cleanliness, a dust collector is required.

#### Dust Generation from the LM System

■ Measure to Prevent Dust Generation Resulting from Flying Grease

#### **THK AFE-CA and AFF Grease**

Use environmentally clean grease that produces little dust.

■ Measure to Reduce Dust Generation Resulting from Metallic Abrasion Dust

#### Caged Ball LM Guide

Use the Caged Ball LM Guide, which has no friction between balls and generates little metallic abrasion dust, to allow generation of dust to be minimized.

#### Corrosion Prevention

#### ■ Material-based Measure

#### Stainless Steel LM Guide

This LM Guide uses martensite stainless steel, which has corrosion resistant effect.

#### **Highly Corrosion Resistant LM Guide**

It uses austenite stainless steel, which has a high corrosion resistant effect, in its LM rail.

■Measure Through Surface Treatment

#### THK AP-HC, AP-C and AP-CF Treatment

The LM system is surface treated to increase corrosion resistance.

Grease

**Setting Conditions** 

## Vacuum

In a vacuum environment, measures are required to prevent gas from being emitted from a resin and the scattering of grease. Anti-rust oil cannot be used, therefore, it is necessary to select a product with high corrosion resistance.

Measure to Prevent Emission of Gas from Resin Stainless Steel LM Guide

The endplate (ball circulation path normally made of resin) of the LM block is made of stainless steel to reduce emission of gas.

■ Measure to Prevent Grease from Evaporating

#### Vacuum Grease

If a general-purpose grease is used in a vacuum environment, oil contained in the grease evaporates and the grease looses lubricity. Therefore, use a vacuum grease that uses fluorine based oil, whose vapor pressure is low, as the base oil.

#### ■Corrosion Prevention

#### Stainless Steel LM Guide

In a vacuum environment, use a stainless steel LM Guide, which is highly corrosion resistant.

#### **High Temperature LM Guide**

If high temperature is predicted due to baking, use a High Temperature LM Guide, which is highly resistant to heat and corrosion.

#### Highly Corrosion Resistant LM Guide

This LM Guide uses austenite stainless steel, which has a high anti-corrosion effect, in the LM rail.

## Oil-Free

In environments susceptible to liquid lubricants, a lubrication method other than grease or oil is required.

### ■Dry Lubricant

#### **Dry Lubrication S-Compound Film**

Dry Lubrication S-Compound Film is a fully dry lubricant developed for use under atmospheric to high-vacuum environments. It has superior characteristics in load carrying capacity, wear resistance and sealability to other lubrication systems.

**Highly Corrosion Resistant LM Guide** 

**Surface Treatment** 

Setting Conditions

# High Speed

In a high speed environment, it is necessary to apply an optimum lubrication method that reduces heat generation during high speed operation and increases grease retention.

#### ■ Measures to Reduce Heat Generation

#### Caged Ball LM Guide

Use of a ball cage eliminates friction between balls to reduce heat generation. In addition, grease retention is increased, thus to achieve long service life and high speed operation.

#### **THK AFA Grease, AFJ Grease**

It reduces heat generation in high speed operation and has superb lubricity.

#### ■ Measure to Improve Lubrication

#### **QZ** Lubricator

Continuous oil lubrication ensures that the lubrication and maintenance interval can significantly be extended. It also applies the right amount of oil to the raceway, making itself an eco-friendly lubrication system that does not contaminate the surrounding area.

## **Caged Ball LM Guide**

### **Caged Roller LM Guide**

SRG SRN SRW

**QZ** Lubricator

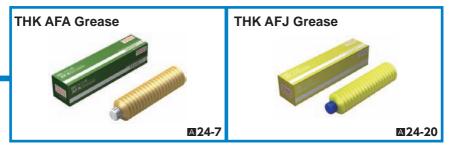

**Grease** 

**Setting Conditions** 

# High Temperature

In a high temperature environment, dimensional alterations caused by heat is problematic. Use a High Temperature LM Guide, which is heat resistant and has minimal dimensional alterations after being heated. Also, use a high temperature grease.

#### ■ Heat Resistance

#### **High Temperature LM Guide**

A special heat treatment to maintain dimensional stability minimizes dimensional variations due to heating and cooling.

#### Grease

#### **High Temperature Grease**

Use a high temperature grease with which the rolling resistance of the LM system is consistent even at high temperature.

# Low Temperature

In a low temperature environment, use an LM system with a minimal amount of resin components and a grease that minimize fluctuations in rolling resistance, even at low temperature.

### Impact of Low Temperature on Resin Components

#### Stainless Steel LM Guide

The endplate (ball circulation path normally made of resin) of the LM block is made of stainless steel.

#### ■Corrosion Prevention

Provide surface treatment to the LM system to increase its corrosion resistance.

#### Grease

Use THK AFC Grease, with which the rolling resistance of the system little is consistent even at low temperature.

# Micro Motion

Micro strokes cause the oil film to break, resulting in poor lubrication and early wear. In such cases, select a grease with which the oil film strength is high and an oil film can easily be formed.

#### Grease

**THK AFC Grease** 

AFC Grease is a urea-based grease that excels in oil film strength and wear resistance.

# High Temperature LM Guide

High Temperature Grease

### **Surface Treatment**

Low Temperature Grease

**Grease** 

**Setting Conditions** 

# Foreign Matter

If foreign matter enters the LM system, it will cause abnormal wear and shorten the service life. Therefore, it is necessary to prevent such entrance of foreign matter.

Especially in an environment containing small foreign matter or a water-soluble coolant that a telescopic cover or a bellows cannot remove, it is necessary to attach a contamination protection accessory capable of efficiently removing foreign matter.

#### ■Metal Scraper

It is used to remove relatively large foreign objects such as cutting chips, spatter and sand or hard foreign matter that adhere to the LM rail.

#### ■Laminated Contact Scraper LaCS

Unlike a metal scraper, it removes foreign matter while it is in contact with the LM rail. Therefore, it demonstrates a high contamination protection effect against small foreign matter, which has been difficult to remove with conventional metal scrapers.

#### ■QZ Lubricator

QZ Lubricator is a lubrication system that feeds the right amount of lubricant by closely contacting its highly oil-impregnated fiber net to the ball raceway.

Metal Cap Dedicated for LM Rail Mounting Holes GC Cap

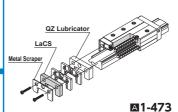

GC cap is a metallic cap that plugs the LM rail mounting hole (article compliant with the RoHS Directives). It prevents the entrance of foreign material and coolant from the LM rail top face (mounting hole) under harsh environments, and significantly increases the dust control performance of the LM Guide if used with a dust control seal.

#### Protector

The protector minimizes the entrance of foreign material even in harsh environments where foreign material such as fine particles and liquids are present.

**Setting Conditions** 

# **Selecting a Type**

## **Types of LM Guides**

THK offers a wide array of types and dimensions with LM Guides as standard so that you can select the optimal product for any application. With the unit structure of each model, you can easily obtain high running accuracy with no clearance simply by mounting the product on a plane surface with bolts. We have a proven track record and know-how in extensive applications with LM Guides.

## **Calculating the Applied Load**

The LM Guide is capable of receiving loads and moments in all directions that are generated due to the mounting orientation, alignment, gravity center position of a traveling object, thrust position and cutting resistance.

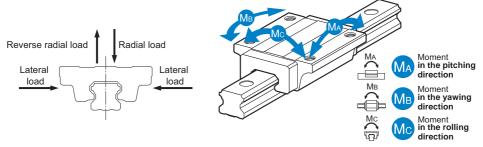

Fig.1 Directions of the Loads Applied on the LM Guide

## **Calculating an Applied Load**

### [Single-Axis Use]

### Moment Equivalence

When the installation space for the LM Guide is limited, you may have to use only one LM block, or double LM blocks closely contacting with each other. In such a setting, the load distribution is not uniform and, as a result, an excessive load is applied in localized areas (i.e., both ends) as shown in Fig.2. Continued use under such conditions may result in flaking in those areas, consequently shortening the service life. In such a case, calculate the actual load by multiplying the moment value by any one of the equivalent-moment factors specified in Table1 to Table7.

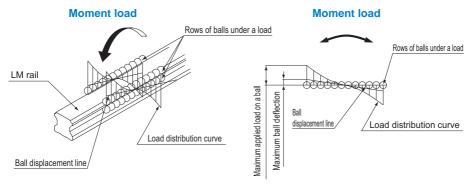

Fig.2 Ball Load when a Moment is Applied

An equivalent-load equation applicable when a moment acts on an LM Guide is shown below.

 $P = K \cdot M$ 

P : Equivalent load per LM Guide (N)

K : Equivalent moment factor

M : Applied moment (N-mm)

Calculating the Applied Load

### Equivalent Factor

Since the rated load is equivalent to the permissible moment, the equivalent factor to be multiplied when equalizing the  $M_A$ ,  $M_B$  and  $M_C$  moments to the applied load per block is obtained by dividing the rated loads in the corresponding directions.

With those models other than 4-way equal load types, however, the load ratings in the 4 directions differ from each other. Therefore, the equivalent factor values for the  $M_A$  and  $M_C$  moments also differ depending on whether the direction is radial or reverse radial.

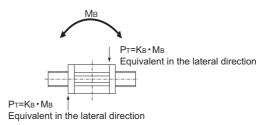

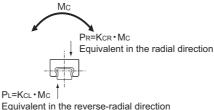

Fig.4 Equivalent Factors for the M<sub>B</sub> Moment

### Equivalent factors for the MB Moment

## **■**Equivalent Factors for the M<sub>c</sub> Moment

Equivalent in the reverse-radial direction

Fig.5 Equivalent Factors for the Mc Moment

### Equivalent factors for the Mc Moment

Equivalent factor in the radial direction Equivalent factor in the reverse radial direction

$$\frac{C_0}{\text{KcR} \cdot \text{Mc}} = \frac{C_{0L}}{\text{KcL} \cdot \text{Mc}} = 1$$

| $C_0$                 | : Basic static load rating (radial direction)         | (N) |
|-----------------------|-------------------------------------------------------|-----|
| $C_{\text{\tiny OL}}$ | : Basic static load rating (reverse radial direction) | (N) |
| $C_{\text{ot}}$       | : Basic static load rating (lateral direction)        | (N) |
| $P_{\text{R}}$        | : Calculated load (radial direction)                  | (N) |
| $P_{\Gamma}$          | : Calculated load (reverse radial direction)          | (N) |
| $P_{\text{T}}$        | : Calculated load (lateral direction)                 | (N) |
|                       |                                                       |     |

### Calculating the Applied Load

Table1 Equivalent Factors (Models SHS, SSR, SVR, SVS, SHW and SRS)

|       | LINE      |                       |                       |                       | Equivale              | ent factor            |                       |                       |                       |

Kara : Equivalent factor in the Ma radial direction when one LM block is used

KAL1 : Equivalent factor in the MA reverse radial direction

when one LM block is used

K<sub>AR2</sub>: Equivalent factor in the M<sub>A</sub> radial direction when two

LM blocks are used in close contact with each other

K<sub>AL2</sub>: Equivalent factor in the M<sub>A</sub> reverse radial direction when two LM blocks are used in close contact with each other  $K_{\tt B1}$  :  $M_{\tt B}$  Equivalent factor when one LM block is used  $K_{\tt B2}$  :  $M_{\tt B}$  Equivalent factor when two LM blocks are used in

close contact with each other

 $\begin{array}{ll} K_{\text{CR}} & : \text{Equivalent factor in the } M_{\text{C}} \text{ radial direction} \\ K_{\text{CL}} & : \text{Equivalent factor in the } M_{\text{C}} \text{ reverse radial direction} \end{array}$ 

Table7 Equivalent Factors (Model JR, NSR, SRG, SRN and SRW)

| Model No.   Kost   Ko                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |         |                       |                    |                  | Equival            | ent factor            |                       |                 |                    |

 $K_{\mbox{\tiny AR1}}$  : Equivalent factor in the  $M_{\mbox{\tiny A}}$  radial direction when one LM block is used

KAL1 : Equivalent factor in the MA reverse radial direction

when one LM block is used

Karz: Equivalent factor in the Ma radial direction when two LM blocks are used in close contact with each other

 $K_{\mbox{\tiny AL2}}\,$  : Equivalent factor in the  $M_{\mbox{\tiny A}}$  reverse radial direction when two LM blocks are used in close contact with each other  $\begin{array}{lll} K_{\text{B}_1} &: M_{\text{B}} \text{ Equivalent factor when one LM block is used} \\ K_{\text{B}2} &: M_{\text{B}} \text{ Equivalent factor when two LM blocks are used in} \\ &: \text{close contact with each other} \end{array}$ 

 $K_{\scriptscriptstyle CR}$  : Equivalent factor in the  $M_{\scriptscriptstyle C}$  radial direction  $K_{\scriptscriptstyle CL}$  : Equivalent factor in the  $M_{\scriptscriptstyle C}$  reverse radial direction

Calculating the Applied Load

### [Double-axis Use]

### Setting Conditions

Set the conditions needed to calculate the LM system's applied load and service life in hours.

The conditions consist of the following items.

- (1) Mass: m (kg)
- (2) Direction of the working load
- (3) Position of the working point (e.g., center of gravity):  $\ell_2$ ,  $\ell_3$ ,  $h_1$ (mm)
- (4) Thrust position:  $\ell_4$ ,  $h_2$ (mm)
- (5) LM system arrangement:  $\ell_0$ ,  $\ell_1$ (mm) (No. of units and axes)
- (6) Velocity diagram

Speed: V (mm/s) Time constant:  $t_n$  (s) Acceleration:  $\alpha_n$ (mm/s²)

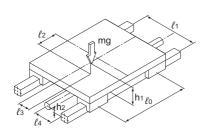

$$(\alpha_n = \frac{V}{t_n})$$

(7) Duty cycle

Number of reciprocations per minute: N<sub>1</sub>(min<sup>-1</sup>)

- (8) Stroke length:  $\ell_s(mm)$
- (9) Average speed: V<sub>m</sub>(m/s)
- (10) Required service life in hours: L<sub>h</sub>(h)

Gravitational acceleration g=9.8 (m/s2)

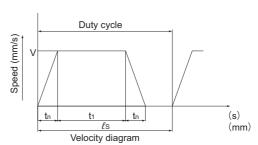

Fig.6 Condition

### Applied Load Equation

The load applied to the LM Guide varies with the external force, such as the position of the gravity center of an object, thrust position, inertia generated from acceleration/deceleration during start or stop, and cutting force.

In selecting an LM Guide, it is necessary to obtain the value of the applied load while taking into account these conditions.

Calculate the load applied to the LM Guide in each of the examples 1 to 10 shown below.

| m            | : Mass                                           | (kg)      |
|--------------|--------------------------------------------------|-----------|
| $\ell_n$     | : Distance                                       | (mm)      |
| $F_n$        | : External force                                 | (N)       |
| $P_n$        | : Applied load (radial/reverse radial direction) | (N)       |
| $P_{nT}$     | : Applied load (lateral directions)              | (N)       |

Calculating the Equivalent Load

## **Calculating the Equivalent Load**

## Rated Load of an LM Guide in Each Direction

The LM Guide is categorized into roughly two types: the 4-way equal load type, which has the same rated load in the radial, reverse radial and lateral directions, and the radial type, which has a large rated load in the radial direction. With the radial type LM Guide, the rated load in the radial direction is different from that in the reverse radial and lateral directions. The basic load rating in the radial direction is indicated in the specification table. The values in the reverse-radial and lateral directions are obtained from Table8 on **\Bartimeta1-58**.

### [Rated Loads in All Directions]

| Туре                  | Load Distribution Curve |
|-----------------------|-------------------------|
| 4-way Equal Load Type | -1/2π 1/2π              |
| Radial Type           | -1/2π 1/2π              |

\*(T): Tensile lateral direction; (C): Compressive lateral direction Note) C and C<sub>o</sub> in the table each represent the basic load rating indicated in the specification table of the respective model.

For types with no size indication in the table, the same factor is applied to all sizes.

Models HR, GSR and GSR-R cannot be used in single-axis applications.

Calculating the Equivalent Load

### [Equivalent Load P<sub>E</sub>]

The LM Guide can bear loads and moments in all directions, including a radial load (PR), reverse radial load (PL) and lateral loads (PT), simultaneously.

When two or more loads (e.g., radial load and lateral load) are simultaneously applied to the LM Guide, the service life and the static safety factor are calculated using equivalent load values obtained by converting all the loads into radial load or reverse radial load.

### [Equivalent Load Equation]

When the LM block of the LM Guide receives loads simultaneously in the radial and lateral directions, or the reverse radial and lateral directions, the equivalent load is obtained from the equation below.

### $P_E = X \cdot P_{R(L)} + Y \cdot P_T$

P<sub>E</sub> : Equivalent load (N)

·Radial direction

·Reverse radial direction

 $P_L$  : Reverse radial load (N)  $P_T$  : Lateral load (N)

X,Y : Equivalent factor (see Table9)

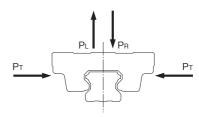

Fig.7 Equivalent of Load of the LM Guide

Table9 Equivalent factor in each direction

Note) If the radial type LM Guide receives radial and lateral loads simultaneously, study the safety static factor and the rated load in the radial-load and lateral-load directions.

For types with no size indication in the table, the same factor is applied to all sizes.

Models HR, GSR and GSR-R cannot be used in single-axis applications.

Calculating the Static Safety Factor

## **Calculating the Static Safety Factor**

To calculate a load applied to the LM Guide, the average load required for calculating the service life and the maximum load needed for calculating the static safety factor must be obtained first. In a system subject to frequent starts and stops, placed under cutting forces or under a large moment caused by an overhang load, an excessively large load may apply to the LM Guide. When selecting a model number, make sure that the desired model is capable of receiving the required maximum load (whether stationary or in motion). Table10 shows reference values for the static safety factor.

Table10 Reference Values for the Static Safety Factor (fs)

| Machine using the LM Guide Load conditions |                             | Lower limit of fs |
|--------------------------------------------|-----------------------------|-------------------|
| General industrial machinery               | Without vibration or impact | 1.0 to 3.5        |
| General industrial macrimery               | With vibration or impact    | 2.0 to 5.0        |
| Machine tool                               | Without vibration or impact | 1.0 to 4.0        |
| iviacrime tooi                             | With vibration or impact    | 2.5 to 7.0        |

| When the reverse radial load is large | Fh•fr•fc•CoL<br>PL ≧fs |
| When the lateral loads are large      | fн•fτ•fc•Coτ<br>Pτ ≧fs |

: Static safety factor fs : Basic static load rating Co (radial direction) (N)  $C_{0L}$ : Basic static load rating (reverse-radial direction) (N) : Basic static load rating (lateral direction) (N)  $P_R$ : Calculated load (radial direction) (N) : Calculated load (reverse-radial direction) (N) Р⊤ : Calculated load (lateral direction) (N) : Hardness factor (see Fig.8 on A1-66) fн f⊤ : Temperature factor (see Fig.9 on **A1-66**) : Contact factor (see Table11 on A1-66) fc

## **Calculating the Average Load**

In cases where the load applied to each LM block fluctuates under different conditions, such as an industrial robot holding a work with its arm as it advances and receding with its arm empty, and a machine tool handling various workpieces, it is necessary to calculate the service life of the LM Block while taking into account such fluctuating loading conditions.

The average load (Pm) is the load under which the service life of the LM Guide is equivalent to that under varying loads applied to the LM blocks.

$$P_{m} = \sqrt[i]{\frac{1}{L} \cdot \sum_{n=1}^{n} (P_{n}^{i} \cdot L_{n})}$$

: Average Load (N)

: Varying load (N)

: Total travel distance (mm)

: Distance traveled under load Pa (mm)

: Constant determined by rolling element

Note) The above equation or the equation (1) below applies when the rolling elements are balls. (1) When the load fluctuates stepwise

LM Guide Using Balls (i=3)

$$P_{m} = \sqrt[3]{\frac{1}{L} (P_{1}^{3} \cdot L_{1} + P_{2}^{3} \cdot L_{2} \cdots + P_{n}^{3} \cdot L_{n})} \quad \cdots \cdots (1)$$

(N) : Average load

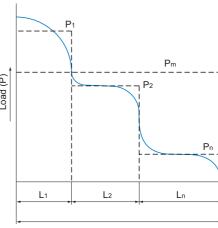

: Varying load (N) : Total travel distance (mm)

: Distance traveled under Pn (mm)

: Average Load (N)

P<sub>n</sub> : Varying load (N) : Total travel distance (mm)

: Distance traveled under P<sub>o</sub> (mm)

Total travel distance (L)

### Calculating the Average Load

(2) When the load fluctuates monotonically

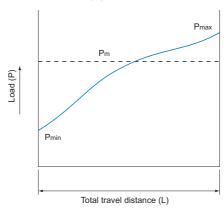

$$P_m \doteq \frac{1}{3} (P_{min} + 2 \cdot P_{max}) \dots (3)$$

P<sub>min</sub>: Minimum load

 $P_{\text{max}}$ 

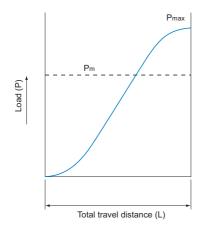

: Minimum load : Maximum load (N)

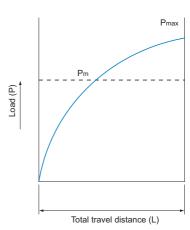

(N)

(3) When the load fluctuates sinusoidally

(a) 
$$P_m = 0.65 P_{max} \cdots (4)$$

## **Calculating the Nominal Life**

The service life of an LM Guide is subject to variations even under the same operational conditions. Therefore, it is necessary to use the nominal life defined below as a reference value for obtaining the service life of the LM Guide. The nominal life means the total travel distance that 90% of a group of units of the same LM Guide model can achieve without flaking (scale-like pieces on the metal surface) after individually running under the same conditions.

## Nominal Life Equation for an LM Guide Using Balls

$$L = \left(\frac{f_{\text{H}} \cdot f_{\text{T}} \cdot f_{\text{C}}}{f_{\text{W}}} \cdot \frac{C}{P_{\text{C}}}\right)^{3} \times 50$$

f<sub>⊤</sub> : Temperature factor

(see Fig.9 on **△1-66**)

f<sub>c</sub> : Contact factor (see Table11 on **A1-66**) f<sub>w</sub> : Load factor (see Table12 on **A1-67**)

## Nominal Life Equation for the Oil-Free LM Guide

$$L = \left(\frac{F_0}{f_w \cdot P_c}\right)^{1.57} \times 50$$

Note) The life here means the service of life of the S film based on wear.

Since the service life of the S film may vary according to the environment or the operating conditions, be sure to evaluate and validate the life under the service conditions and operating conditions at the customer.

Calculating the Nominal Life

## Nominal Life Equation for an LM Guide Using Rollers

$$L = \left(\frac{f_{\text{H}} \cdot f_{\text{T}} \cdot f_{\text{C}}}{f_{\text{W}}} \cdot \frac{C}{P_{\text{C}}}\right)^{\frac{10}{3}} \times 100$$

L : Nominal life (km)
C : Basic dynamic load rating (N)
Pc : Calculated load (N)
f<sub>H</sub> : Hardness factor (see Fig.8 on ■1-66)

f<sub>⊤</sub> : Temperature factor

(see Fig.9 on **△1-66**)

f<sub>c</sub> : Contact factor (see Table11 on **Δ1-66**) f<sub>w</sub> : Load factor (see Table12 on **Δ1-67**)

Once the nominal life (L) has been obtained, the service life time can be obtained using the following equation if the stroke length and the number reciprocations are constant.

$$L_h = \frac{L \times 10^6}{2 \times \ell_s \times n_1 \times 60}$$

### [fH: Hardness Factor]

To ensure the achievement of the optimum load capacity of the LM Guide, the raceway hardness must be between 58 and 64 HRC.

If the hardness is lower than this range, the basic dynamic load rating and the basic static load rating decrease. Therefore, it is necessary to multiply each rating by the respective hardness factor  $(f_{\text{H}})$ .

Since the LM Guide has sufficient hardness, the  $f_{\mbox{\tiny H}}$  value for the LM Guide is normally 1.0 unless otherwise specified.

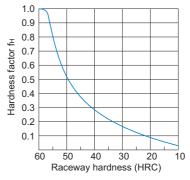

Fig.8 Hardness Factor (fH)

### [f<sub>T</sub>:Temperature Factor]

If the temperature of the environment surrounding the operating LM Guide exceeds 100°C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.9.

In addition, the selected LM Guide must also be of a high temperature type.

Note) LM guides not designed to withstand high temperatures should be used at 80°C or less.Please contact THK if application requirements exceed 80°C.

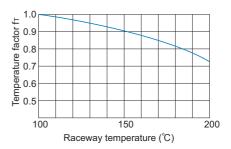

Fig.9 Temperature Factor (f<sub>T</sub>)

### [fc: Contact Factor]

When multiple LM blocks are used in close contact with each other, it is difficult to achieve uniform load distribution due to moment loads and mounting-surface accuracy. When using multiple blocks in close contact with each other, multiply the basic load rating (C or C<sub>0</sub>) by the corresponding contact factor indicated in Table11.

Note) If uneven load distribution is expected in a large machine, take into account the respective contact factor indicated in Table11.

Table11 Contact Factor (fc)

| Number of blocks used in close contact | Contact factor fc |
|----------------------------------------|-------------------|
| 2                                      | 0.81              |
| 3                                      | 0.72              |
| 4                                      | 0.66              |
| 5                                      | 0.61              |
| 6 or more                              | 0.6               |
| Normal use                             | 1                 |

### Calculating the Nominal Life

### [fw: Load Factor]

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, where the effects of speed and vibration are estimated to be significant, divide the basic dynamic load rating (C) by a load factor selected from Table12, which contains empirically obtained data.

Table12 Load Factor (fw)

| Vibrations/<br>impact | Speed (V)                                                | fw         |
|-----------------------|----------------------------------------------------------|------------|
| Faint                 | Very low<br>V≦0.25m/s                                    | 1 to 1.2   |
| Weak                  | low<br>0.25 <v≦1m s<="" td=""><td>1.2 to 1.5</td></v≦1m> | 1.2 to 1.5 |
| Medium                | Medium<br>1 <v≦2m s<="" td=""><td>1.5 to 2</td></v≦2m>   | 1.5 to 2   |
| Strong                | High<br>V>2m/s                                           | 2 to 3.5   |

## **Predicting the Rigidity**

## **Selecting a Radial Clearance (Preload)**

Since the radial clearance of an LM Guide greatly affects the running accuracy, load carrying capacity and rigidity of the LM Guide, it is important to select an appropriate clearance according to the application. In general, selecting a negative clearance (i.e., a preload\* is applied) while taking into account possible vibrations and impact generated from reciprocating motion favorably affects the service life and the accuracy.

For specific radial clearances, contact THK. We will help you select the optimal clearance according to the conditions.

The clearances of all LM Guide models (except model HR, GSR and GSR-R, which are separate types) are adjusted as specified before shipment, and therefore they do not need further preload adjustment.

\*Preload is an internal load applied to the rolling elements (balls, rollers, etc.) of an LM block in advance in order to increase its rigidity.

Table13 Types of Radial Clearance

|                          | Normal Clearance                                                                                                                                                                                                                       | Clearance C1 (Light Preload)                                                                                                                                                                                                                                                                        | Clearance C0 (Medium Preload)                                                                                                                                                                   |

## Service Life with a Preload Considered

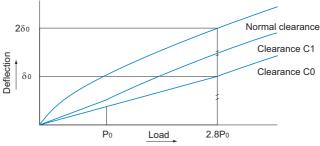

When using an LM Guide under a medium preload (clearance C0), it is necessary to calculate the service life while taking into account the magnitude of the preload.

To identify the appropriate preload for any selected LM Guide model, contact THK.

## **Rigidity**

When the LM Guide receives a load, its rolling element, LM blocks and LM rails are elastically deformed within a permissible load range. The ratio between the displacement and the load is called rigidity value. (Rigidity values are obtained using the equation shown below.) The LM Guide's rigidity increases according to the magnitude of the preload. Fig.10 shows rigidity difference between normal, C1 and C0 clearances.

The effect of a preload for a 4-way equal load type is translated into the calculated load approx. 2.8 times greater than the magnitude of the preload.

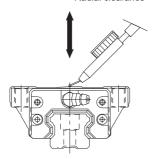

P<sub>0</sub>: Magnitude of clearance C0

Fig.10 Rigidity Data

$$K = \frac{P}{\delta}$$

## **Point of Selection**

Predicting the Rigidity

## [Radial Clearance for the Oil-Free LM Guide Model SR-MS]

Unit: µm

| Indication symbol | Clearance CS |  |  |
|-------------------|--------------|--|--|
| Model No.         | Clearance CS |  |  |
| 15                | −2 to +1     |  |  |
| 20                | -2 to +1     |  |  |

## **Determining the Accuracy**

## **Accuracy Standards**

Accuracy of the LM Guide is specified in terms of running parallelism, dimensional tolerance for height and width, and height and width difference between a pair when 2 or more LM blocks are used on one rail or when 2 or more rails are mounted on the same plane.

For details, see "Accuracy Standard for Each Model" on A1-76 to A1-86.

#### [Running of Parallelism]

It refers to the tolerance for parallelism between the LM block and the LM rail reference surface when the LM block travels the whole length of the LM rail with the LM rail secured on the reference reference surface using bolts.

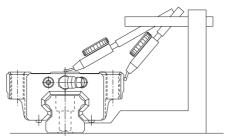

Fig.11 Running of Parallelism

#### [Difference in Height M]

Indicates a difference between the minimum and maximum values of height (M) of each of the LM blocks used on the same plane in combination.

#### [Difference in Width W<sub>2</sub>]

Indicates a difference between the minimum and maximum values of the width (W<sub>2</sub>) between each of the LM blocks, mounted on one LM rail in combination, and the LM rail.

Note1) When 2 or more rails are used on the same plane in parallel, only the width (W<sub>2</sub>) tolerance and the difference on the master rail apply. The master LM rail is imprinted with "KB" (except for normal grade products) following the serial number.

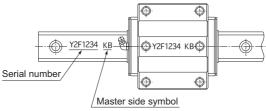

Fig.12 Master LM Rail

Note2) Accuracy measurements each represent the average value of the central point or the central area of the LM block.

Note3) The LM rail is smoothly curved so that the required accuracy is easily achieved by pressing the rail to the reference surface of the machine.

If it is mounted on a less rigid base such as an aluminum base, the curve of the rail will affect the accuracy of the machine. Therefore, it is necessary to define straightness of the rail in advance.

## **Guidelines for Accuracy Grades by Machine Type**

Table14 shows guidelines for selecting an accuracy grade of the LM Guide according to the machine type.

Table14 Guideline for Accuracy Grades by Machine Type

| Time of machine                             |                                        |     |     | Accı   | uracy gra |   |    |    |

## **Accuracy Standard for Each Model**

Accuracies of models SHS, SSR, SVR/SVS, SHW, HSR, SR, NR/NRS, HRW, NSR-TBC, HSR-M1, HSR-M1VV, SR-M1, HSR-M2, SRG and SRN are categorized into Ct7 grade (Ct7), Ct5 grade (Ct5), Normal grade (no symbol), High accuracy grade (H), Precision grade (P), Super precision grade (SP) and Ultra precision grade (UP) by model numbers, as indicated in Table16 on M1-77.

Note) XFor models SRG and SRN, only precision or higher grades apply. (Ct7 grade, Ct5 grade, normal grade and high accuracy grade are not available.)

Note) Ct7 and Ct5 class are only applicable for model HSR.

Note) The difference between Ct7 grade and Ct5 grade pairs with a height M and a width W₂ is the value for one shaft.

• Accuracies of model HMG are defined by model number as indicated in Table17.

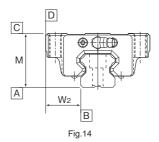

Table17 Model HMG Accuracy Standard

Unit: mm

| Model    | Accuracy Standards                                       | Normal grade                     |
|----------|----------------------------------------------------------|----------------------------------|
| No.      | Item                                                     | No symbol                        |
| 15       | Dimensional tolerance in height M                        | ±0.1                             |
|          | Difference in height M                                   | 0.02                             |
|          | Dimensional tolerance in width W <sub>2</sub>            | ±0.1                             |
|          | Difference in width W <sub>2</sub>                       | 0.02                             |
|          | Running parallelism of<br>surface C against<br>surface A | ΔC (as shown in Table18)         |
|          | Running parallelism of<br>surface D against<br>surface B | $\Delta D$ (as shown in Table18) |
|          | Dimensional tolerance in height M                        | ±0.1                             |
|          | Difference in height M                                   | 0.02                             |
|          | Dimensional tolerance in width W <sub>2</sub>            | ±0.1                             |
| 25       | Difference in width W2                                   | 0.03                             |
| 35       | Running parallelism of<br>surface C against<br>surface A | ΔC (as shown in Table18)         |
|          | Running parallelism of<br>surface D against<br>surface B | $\Delta D$ (as shown in Table18) |
|          | Dimensional tolerance in height M                        | ±0.1                             |
|          | Difference in height M                                   | 0.03                             |
|          | Dimensional tolerance in width W <sub>2</sub>            | ±0.1                             |
| 45<br>65 | Difference in width W2                                   | 0.03                             |
|          | Running parallelism of<br>surface C against<br>surface A | ΔC (as shown in Table18)         |
|          | Running parallelism of surface D against                 | ΔD (as shown in Table18)         |

Table18 LM Rail Length and Running Parallelism by Accuracy Standard

Unit: µm

| LM rail ler | ngth (mm) | Running Parallelism Values |
|-------------|-----------|----------------------------|
| Above       | Or less   | Normal grade               |
| _           | 125       | 30                         |

#### **Point of Selection**

**Determining the Accuracy** 

• Accuracies of model HR are categorized into normal, high accuracy, precision, super precision and ultra precision grades as indicated in Table25.

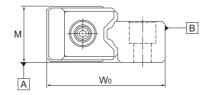

Fig.18 Table25 Accuracy Standard for Model HR

Unit: mm

| Accuracy standards                                               | Normal<br>grade                    | High-<br>accuracy<br>grade | Precision grade | Super<br>precision<br>grade | Ultra<br>precision<br>grade |
|------------------------------------------------------------------|------------------------------------|----------------------------|-----------------|-----------------------------|-----------------------------|
| Item                                                             | No Symbol                          | Н                          | Р               | SP                          | UP                          |
| Dimensional tolerance in height M                                | ±0.1                               | ±0.05                      | ±0.025          | ±0.015                      | ±0.01                       |
| Difference in height M Note 1)                                   | 0.03                               | 0.02                       | 0.01            | 0.005                       | 0.003                       |
| Dimensional tolerance for total width $W_{\scriptscriptstyle 0}$ | ±0.1                               |                            | ±0.05           |                             |                             |
| Difference in total width W <sub>0</sub> Note 2)                 | 0.03                               | 0.015                      | 0.01            | 0.005                       | 0.003                       |
| Parallelism of the raceway against surfaces A and B              | t $\Delta C$ (as shown in Table26) |                            |                 |                             |                             |

Note1) Difference in height M applies to a set of LM Guides used on the same plane.

Note2) Difference in total width W<sub>0</sub> applies to LM blocks used in combination on one LM rail.

Note3) Dimensional tolerance and difference in total width W<sub>0</sub> for precision and higher grades apply only to the master-rail side among a set of LM Guides. The master rail is imprinted with "KB" following a serial number.

Table26 LM Rail Length and Running Parallelism by Accuracy Standard

Unit: µm

| LM rail ler | ngth (mm) | Running Parallelism Values |                     |                 |                       |                       |
|-------------|-----------|----------------------------|---------------------|-----------------|-----------------------|-----------------------|

#### **Point of Selection**

**Determining the Accuracy** 

Accuracies of models SRS, RSR, RSR-M1, RSR-W, RSR-Z and RSR-WZ are categorized into normal, high accuracy and precision grades by model number as indicated in Table31.

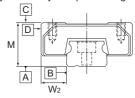

Fig.21

Table31 Accuracy Standards for Models SRS, RSR, RSR-M1, RSR-W, RSR-Z and RSR-WZ

Unit: mm

LM Guide

**Features and Dimensions of Each Model** 

# **Structure and Features of the Caged Ball LM Guide**

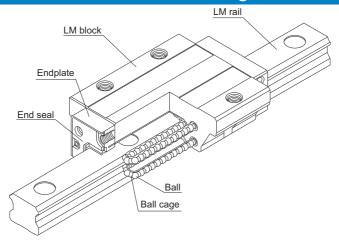

Fig.1 Structural Drawing of the Caged Ball LM Guide Model SHS

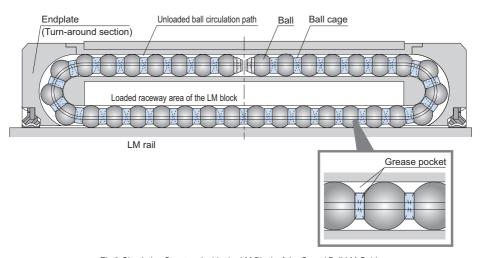

Fig.2 Circulation Structure inside the LM Block of the Caged Ball LM Guide

With the Caged Ball LM Guide, the use of a ball cage allows lines of evenly spaced balls to circulate, thus to eliminate friction between the balls.

In addition, grease held in a space between the ball circulation path and the ball cage (grease pocket) is applied on the contact surface between each ball and the ball cage as the ball rotates, forming an oil film on the ball surface. As a result, an oil film is not easily broken.

## **Features and Dimensions of Each Model**

Structure and Features of the Caged Ball LM Guide

## **Advantages of the Ball Cage Technology**

- (1) The absence of friction between balls, together with increased grease retention, achieves long service life and long-term maintenance-free (lubrication-free) operation.
- (2) The absence of ball-to-ball collision achieves low noise and acceptable running sound.
- (3) The absence of friction between balls achieves low heat generation and high speed operation.
- (4) The circulation of lines of evenly spaced balls ensures smooth ball rotation.
- (5) The absence of friction between balls allows high grease retention and low dust generation.

## [Long Service Life and Long-term Maintenance-free Operation]

Nominal Life Equation for the LM Guide

$$L = \left(\frac{C}{P}\right)^3 \times 50$$

L : Nominal life (km)
C : Basic dynamic load rating (N)
P : Applied load (N)

As indicated in the equation, the greater the basic dynamic load rating, the longer the nominal life of the LM Guide.

## [Example of Calculation]

Comparison of Nominal Life Between the Caged Ball LM Guide model SHS25V and the Conventional Full-ball Type Model HSR25A

### Calculation Assuming P = 11.1kN

Basic dynamic rated load (C) of SHS25V = 31.7kN Basic dynamic rated load (C) of HSR25A = 19.9kN

Model SHS25V 
$$L = \left(\frac{C}{P}\right)^3 \times 50 = \left(\frac{31.7}{11.1}\right)^3 \times 50 = 1160 \text{ km}$$

Model HSR25A 
$$L = \left(\frac{C}{P}\right)^3 \times 50 = \left(\frac{19.9}{11.1}\right)^3 \times 50 = 280 \text{ km}$$

The nominal life of the Caged Ball LM Guide model SHS25V is 4.0 times\* longer than the conventional full-ball type model HSR25A.

\*When selecting a model number, it is necessary to perform a service life calculation according to the conditions.

## • Data on Long Service Life and Long-term Maintenance-free Operation

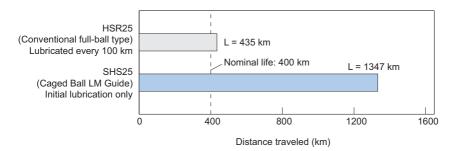

Use of a ball cage eliminates friction between balls and increases grease retention, thus to achieve long service life and long-term maintenance-free operation.

[Condition]

Model No. : SHS25/HSR25
Speed : 60m/min
Stroke : 350mm
Acceleration: 9.8m/s²
Orientation : horizontal

Load : Caged Ball LM Guide model SHS: 11.1kN

Conventional full-ball type model HSR: 9.8kN

#### **Features and Dimensions of Each Model**

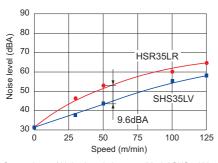

Structure and Features of the Caged Ball LM Guide

## [Low Noise, Acceptable Running Sound]

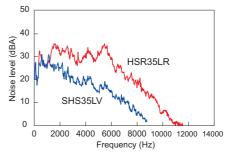

#### Noise Level Data

Since the ball circulation path inside the LM block is made of resin, metallic noise between balls and the LM block is eliminated. In addition, use of a ball cage eliminates metallic noise of ball-to-ball collision, allowing a low noise level to be maintained even at high speed.

Model SHS35LV: Caged Ball LM Guide Model HSR35LR: conventional full-ball type

Comparison of Noise Levels between Model SHS35LV and Model HSR35LR

Comparison of Noise Levels between Model SHS35LV and Model HSR35LR (at speed of 50 m/min)

#### [High Speed]

## High-speed Durability Test Data

Since use of a ball cage eliminates friction between balls, only a low level of heat is generated and superbly high speed is achieved.

[Condition]

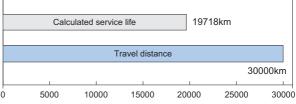

Model No. : Caged Ball LM Guide Model SHS65LVSS

Speed : 2500mm Stroke

Lubrication: initial lubrication only

: 200m/min

Applied load: 34.5kN Acceleration: 1.5G

Distance traveled (km)

Grease remains, and no anomaly is observed in the balls and grease.

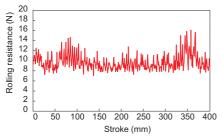

Detail view of the ball cage

#### [Smooth Motion]

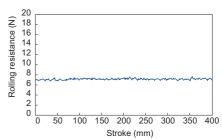

#### Rolling Resistance Data

Use of a ball cage allows the balls to be uniformly aligned and prevents a line of balls from meandering as they enter the LM block. This enables smooth and stable motion to be achieved, minimizes fluctuations in rolling resistance, and ensures high accuracy, in any mounting orientation.

Model SHS25LV: Caged Ball LM Guide Model HSR25LR: conventional full-ball type

Rolling Resistance Fluctuation Data with HSR25LR (Feeding speed: 10mm/sec)

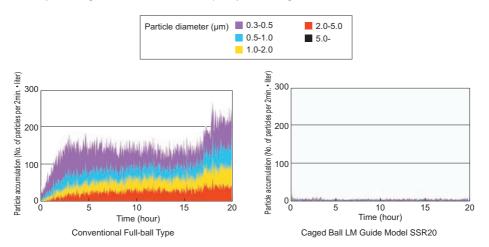

Rolling Resistance Fluctuation Data with SHS25LV (Feeding speed: 10mm/sec)

#### [Low dust generation]

#### Low Dust Generation Data

In addition to friction between balls, metallic contact has also been eliminated by using resin for the through holes. Furthermore, the Caged Ball LM Guide has a high level of grease retention and minimizes fly loss of grease, thus to achieve superbly low dust generation.

## Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and ball cages and endplates incorporated in the LM block allow the balls to circulate.

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations. In addition, the LM block can receive a well-balanced preload, increasing the rigidity in the four directions while maintaining a constant, low friction coefficient. With the low sectional height and the high rigidity design of the LM block, this model achieves highly accurate and stable straight motion.

#### [4-way Equal Load]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

#### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

#### [Global Standard Size]

SHS is designed to have dimensions almost the same as that of Full Ball LM Guide model HSR, which THK as a pioneer of the linear motion system has developed and is practically a global standard size.

#### [Low Center of Gravity, High Rigidity]

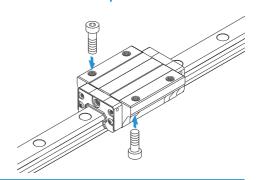

As a result of downsizing the LM rail section, the center of gravity is lowered and the rigidity is increased.

## **Types and Features**

## **Model SHS-C**

The flange of the LM block has tapped holes. Can be mounted from the top or the bottom. Used in places where the table cannot have through holes for mounting bolts.

## Specification Table⇒▲1-98

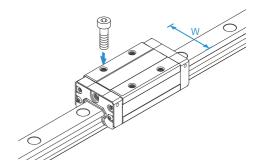

## **Model SHS-V**

With this type, the LM block has a smaller width (W) and tapped holes.

Used in places where the space for table width is limited

## Specification Table⇒A1-100

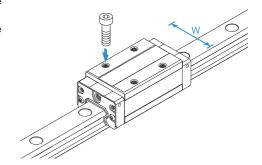

## **Model SHS-R**

The LM block has a smaller width (W) and the mounting holes are tapped.

It succeeds the height dimension of full-ball type LM Guide HSR-R.

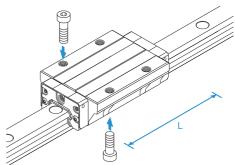

Specification Table⇒A1-102

## **Model SHS-LC**

The LM block has the same cross-sectional shape as model SHS-C, but has a longer overall LM block length (L) and a greater rated load.

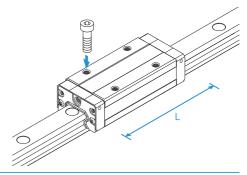

## Specification Table⇒**A**1-98

## **Model SHS-LV**

The LM block has the same cross-sectional shape as model SHS-V, but has a longer overall LM block length (L) and a greater rated load.

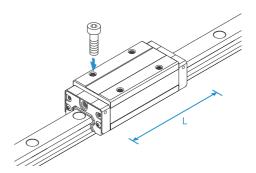

## Specification Table⇒A1-100

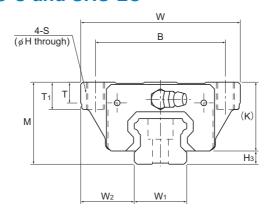

## **Model SHS-LR**

The LM block has the same cross-sectional shape as model SHS-R, but has a longer overall LM block length (L) and a greater rated load.

## Specification Table⇒A1-102

#### Model number coding

#### 2 QZ KKHH C0 +1200L P Z SHS25 LC

Model Type of LM block number

With QZ Lubricator Contamination protection accessory symbol (\*1)

LM rail length (in mm)

With steel tape Symbol for LM rail plane (\*4) jointed use

Symbol for No. of rails used on the same

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

Accuracy symbol (\*3) Normal grade (No Symbol)/High accuracy grade (H)
Precision grade (P)/Super precision grade (SP)

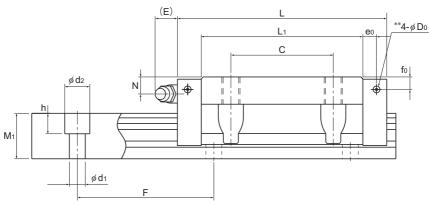

Ultra precision grade (UP)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-70. (\*3) See A1-77. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)
Those models equipped with QZ Lubricator cannot have a grease nipple.

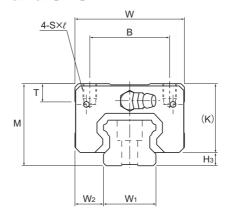

Unit: mm

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product. THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other THK will mount grease hippies per your request. Therefore, do not do the discussion for the maximum length under "Length" indicates the standard maximum length of an LM rail. (See **In-104**.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product.

THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other than mounting a grease nipple.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-104.)
Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

### Model number coding

**KKHH** C0 +1200L SHS45 LR

Model number

Type of LM block With QZ Lubricator Contamination protection accessory symbol (\*1)

LM rail length (in mm)

Symbol for LM rail jointed use Symbol for No. of rails used on the same plane (\*4)

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

Accuracy symbol (\*3)

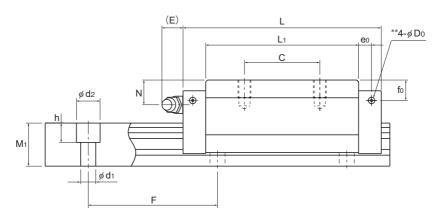

Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-70. (\*3) See A1-77. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.) Those models equipped with QZ Lubricator cannot have a grease nipple.

Unit: mm

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product. THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other than mounting a grease nipple.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See A1-104.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

## Standard Length and Maximum Length of the LM Rail

Table1 shows the standard and maximum lengths of the SHS model rail. If a rail length longer than the listed max length is required, rails may be jointed to meet the overall length. Contact THK for details. For special rail lengths, it is recommended to use a value corresponding to the G dimension from the table. As the G dimension increases, this portion becomes less stable and the accuracy performance is severely impacted.

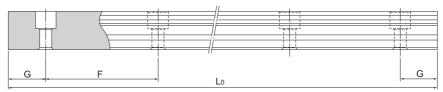

Table1 Standard Length and Maximum Length of the LM Rail for Model SHS

Unit: mm

| Model No.                                    | SHS 15                                                                                                                                          | SHS 20                                                                                                                                                                           | SHS 25                                                                                                                                                                                                           | SHS 30                                                                                                                                                                                                                      | SHS 35                                                                                                                                  | SHS 45                                                                                                                                                                                          | SHS 55                                                                                                                                             | SHS 65                       |

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

## **Tapped-hole LM Rail Type of Model SHS**

SHS model rails also include a type where the LM rail is tapped from the bottom. This type is useful when mounting from the bottom of the base and when increased contamination protection is desired.

- (1) Determine the bolt length so that a clearance of 2 to 5 mm is secured between the bolt end and the bottom of the tap (effective tap depth). (See figure above.)
- (2) For standard pitches of the taps, see Table1 on **A1-104**.

## **Structure and Features**

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and ball cages and endplates incorporated in the LM block allow the balls to circulate.

Use of the ball cage eliminates friction between balls and increases grease retention, thus to achieve low noise, high speed and long-term maintenance-free operation.

#### [Compact, Radial Type]

Since it is a compactly designed model that has a low sectional height and a ball contact structure in the radial direction, this model is optimal for horizontal guide units.

#### [Superb Planar Running Accuracy]

Use of a ball contact structure that is highly resistant to loads in the radial direction minimizes radial displacement under radial loads and provides stable, highly accurate motion.

#### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

#### [Stainless Steel Type also Available as Standard]

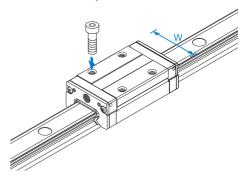

A stainless steel type with its LM block, LM rail and balls all made of stainless steel, which is superbly corrosion resistant, is also available as standard.

## **Types and Features**

## **Model SSR-XW**

With this type, the LM block has a smaller width (W) and tapped holes.

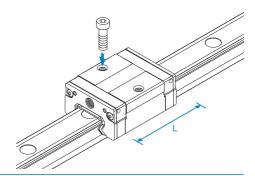

## Specification Table⇒A1-110

## **Model SSR-XV**

This type has the same cross-sectional shape as SSR-XW but has a shorter overall LM block length (L).

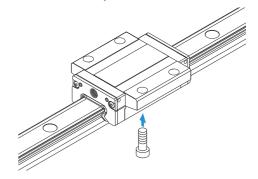

## Specification Table⇒A1-112

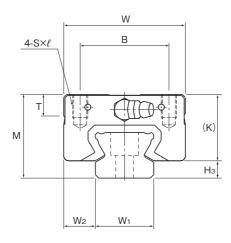

## Model SSR-XTB

Since the LM block can be mounted from the bottom, this type is optimal for applications where through holes for mounting bolts cannot be drilled on the table.

## Specification Table⇒A1-114

Note1) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product. THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other than mounting a grease nipple.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **\( \bigcirc 1-116.**) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

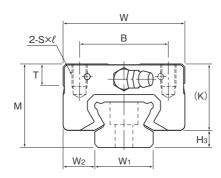

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note2) For models SSR15 and 25, two types of rails with different mounting hole dimensions are offered (see Table1). When, replacing this model with model SR, pay attention to the mounting hole dimension of the LM rail. Contact THK for details.

Table1 The dimension of the rail mounting hole

Note1) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product. THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other than mounting a grease nipple.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-116.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

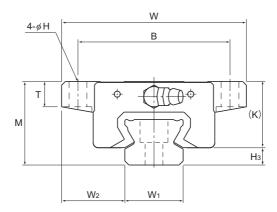

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note2) For models SSR15 and 25, two types of rails with different mounting hole dimensions are offered (see Table1). When, replacing this model with model SR, pay attention to the mounting hole dimension of the LM rail. Contact THK for details.

Table1 The dimension of the rail mounting hole

| Model No. | Standard rail     | Semi-Standard rail |
|-----------|-------------------|--------------------|
| SSR 15    | For M4 (Symbol Y) | For M3 (No symbol) |
| SSR 25    | For M6 (Symbol Y) | For M5 (No symbol) |

## Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model SSR variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

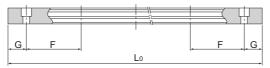

Table1 Standard Length and Maximum Length of the LM Rail

Unit: mm

| Model No.                                 | SSR 15X                                                                                                                                                         | SSR 20X                                                                                                                                             | SSR 25X                                                                                                                                                            | SSR 30X                                                                                                                                                     | SSR 35X                                                                                                                                                     |

|                                           | 500 (1240)                                                                                                                                                      | 3000 (1480)                                                                                                                                         | 3000 (2020)                                                                                                                                                        | 3000 (2520)                                                                                                                                                 | 3000                                                                                                                                                        |

Note1) The maximum length varies with accuracy grades. Contact THK for details.

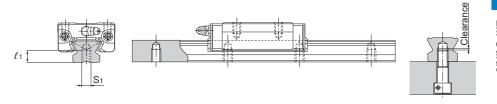

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

Note3) The values in the parentheses indicate the maximum lengths of stainless steel types.

# Tapped-hole LM Rail Type of Model SSR

SSR model rails also include a type where the LM rail is tapped from the bottom. This type is useful when mounting from the bottom of the base and when increased contamination protection is desired.

- (1) A tapped-hole LM rail type is available only for high accuracy or lower grades.
- (2) Determine the bolt length so that a clearance of 2 to 5 mm is secured between the bolt end and the bottom of the tap (effective tap depth). (See figure above.)
- (3) For standard pitches of the taps, see Table1 on **A1-116**.

Table2 Dimensions of the LM Rail Tap Unit: mm

| Model No. | S <sub>1</sub> | Effective tap depth $\ell_1$ |
|-----------|----------------|------------------------------|
| SSR 15X   | M5             | 7                            |
| SSR 20X   | M6             | 9                            |

#### Structure and Features

Models SVR/SVS have especially high rigidity and load carrying capacity among the Caged Ball LM Guide series. In addition, these models maintain the LM Guide performance and achieve high reliability through the strengthening of the dust proof performance with a broad range of options that take into account the service environments of machine tools, etc.

\*Since models SVR/SVS have very high rigidity, their structures are easily affected by the misalignment of the mounting surface and the installation error. If affected by these factors, their service life may be shortened or their motion may be disrupted. When considering using these models, contact THK.

#### [Super Heavy Load, Increased Damping]

The raceway of models SVR/SVS adopts a circular-arc deep groove with a curvature approximate to the ball diameter. Since the ball contact area increases as the applied load increases, a large load carrying capacity is achieved and damping is also improved.

#### [Increased Dust-proof Performance]

The foreign material removal function is improved with a newly developed protector to strengthen the dust-proof performance. In addition, use of a side scraper reduces the entrance of foreign material into the LM block, thus maintaining the LM Guide performance for a long period even in adverse environments.

#### [High Rigidity]

Models SVR/SVS achieve the highest rigidity among the Caged Ball LM Guide series.

Both the radial type SVR and the 4-way equal load type SVS are available for the same size. Depending on the intended use, you can select either type.

#### [Wide Array of Options]

Various options are available, including end seal, inner seal, side seal, Laminated Contact Scraper LaCS, protector, side scraper and Cap GC, to respond to diversified service environments.

#### [Models SVR/SVS Contamination Protection Performance Evaluation]

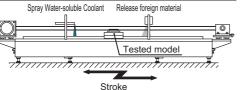

Models SVR/SVS maintain their performance under severe conditions with fine particles or liquid contamination.

#### Models SVR/SVS with option (TTHHYY option)

## TTHHYY Option:

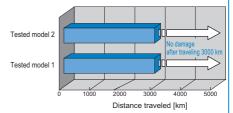

Double Seals Laminated Contact Scraper LaCS Protector

Side Scraper

#### Test Result

After traveling 3000 km

Models SVR/SVS maintain their performance even after traveling 3000 km under severe conditions with exposure to coolant and contamination.

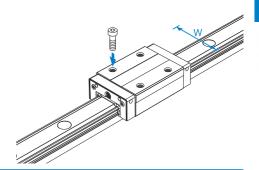

## **Types and Features**

## Models SVR-R/SVS-R

With this type, the LM block has a smaller width (W) and tapped holes.

Used in places where the space for table width is limited.

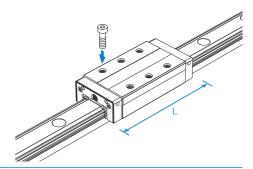

#### Specification Table⇒A1-124/A1-126

## Models SVR-LR/SVS-LR

The LM block has the same cross-sectional shape as models SVR/SVS-R, but has a longer overall LM block length (L) and a greater rated load.

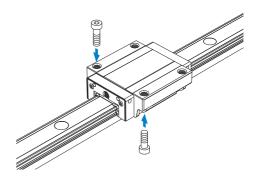

## Specification Table⇒A1-124/A1-126

## Models SVR-C/SVS-C

The flange of the LM block has tapped holes. Can be mounted from the top or the bottom. Can also be used in places where the table cannot have through holes for mounting bolts.

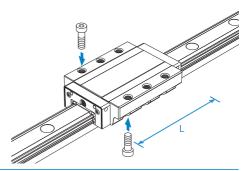

Specification Table⇒A1-128/A1-130

## Models SVR-LC/SVS-LC

The LM block has the same cross-sectional shape as models SVR/SVS-C, but has a longer overall LM block length (L) and a greater rated load.

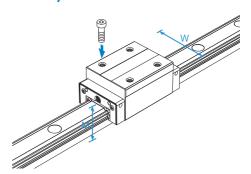

#### Specification Table⇒A1-128/A1-130

## Models SVR-RH/SVS-RH (Build to Order)

The dimensions are almost the same as that of LM Guide models SHS and HSR, and the LM block has tapped holes.

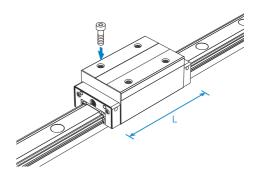

## Specification Table⇒A1-132

## Models SVR-LRH/SVS-LRH (Build to Order)

The LM block has the same cross-sectional shape as models SVR/SVS-RH, but has a longer overall LM block length (L) and a greater rated load.

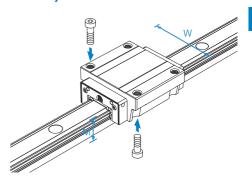

### Specification Table⇒A1-132

## Models SVR-CH/SVS-CH (Build to Order)

Specification Table⇒A1-134

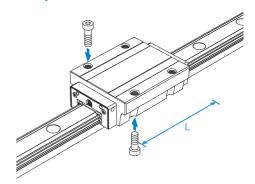

The dimensions are similar to that of LM Guide models SHS and HSR, and the flange of the LM block has tapped holes.

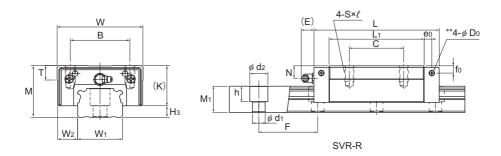

## Models SVR-LCH/SVS-LCH (Build to Order)

Specification Table⇒A1-134

The LM block has the same cross-sectional shape as models SVR/SVS-CH, but has a longer overall LM block length (L) and a greater rated load.

## Models SVR-R and SVR-LR

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product. THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other

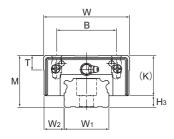

than mounting a grease nipple.

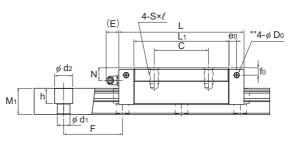

In case of oil lubrication, be sure to let THK know the mounting orientation and the exact position in each LM block where the piping joint should be attached.

For the mounting orientation and the lubrication, see **1-12** and **24-2**, respectively. The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **1-136**.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product.

THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other

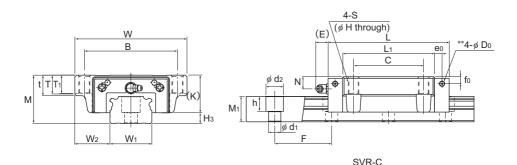

than mounting a grease nipple.

In case of oil lubrication, be sure to let THK know the mounting orientation and the exact position in each LM block where the piping joint should be attached.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **\( \)**1-136.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product.

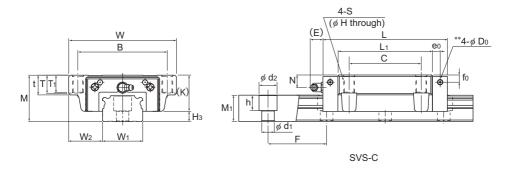

THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other than mounting a grease nipple.

In case of oil lubrication, be sure to let THK know the mounting orientation and the exact position in each LM block

where the piping joint should be attached.

Where the piping joint should be attached. For the mounting orientation and the lubrication, see \$\mathbb{A}\$1-12 and \$\mathbb{A}\$24-2, respectively. The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See \$\mathbb{A}\$1-136.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

#### Model number coding

#### SVR35 RHTTHH

Model No. Type of LM block With QZ

Lubricator protection accessory symbol (\*1)

LM rail length (in mm) Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

Symbol for No. of rails LM rail jointed use used on the same plane (\*4)

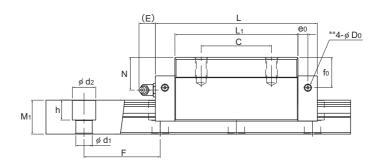

Accuracy symbol (\*3) Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

No. of LM blocks used on the same rail

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-70. (\*3) See A1-77. (\*4) See A1-13.

Note) This model number indicates that an LM block and an LM rail constitute one set (i.e., the required number of sets when 2 rails are used in parallel is 2). Those models equipped with QZ Lubricator cannot have a grease nipple

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product. THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other

than mounting a grease nipple. In case of oil lubrication, be sure to let THK know the mounting orientation and the exact position in each LM block where the piping joint should be attached.

For the mounting orientation and the lubrication, see 11-12 and 124-2, respectively.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See 11-136.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block.

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

## Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model SVR/SVS variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details.

For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

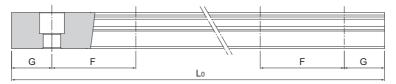

Table1 Standard Length and Maximum Length of the LM Rail for Models SVR/SVS

Unit: mm

| Model No.                                            | SVR/SVS 25                                                                                                                                      | SVR/SVS 30                                                                                                                                          | SVR/SVS 35                                                                                                                                          | SVR/SVS 45                                                                                                                          | SVR/SVS 55                                                                                                    | SVR/SVS 65                      |

#### Structure and Features

A wide and highly rigid LM Guide that uses ball cages to achieve low noise, long-term maintenancefree operation and high speed.

#### [Wide, Low Center of Gravity]

Model SHW, which has a wide LM rail and a low center of gravity, is optimal for locations requiring space saving and large  $M_c$  moment rigidity.

#### [4-way Equal Load]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

#### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

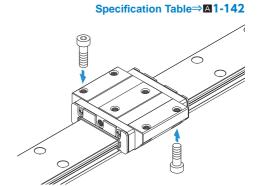

#### [Low Dust Generation]

Use of ball cages eliminates friction between balls and retains lubricant, thus achieving low dust generation.

## **Types and Features**

## **Model SHW-CA**

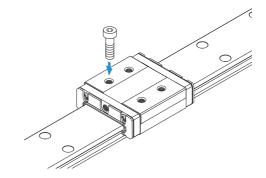

The flange of the LM block has tapped holes. Can be mounted from the top or the bottom.

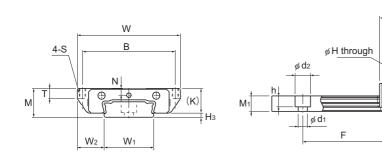

## **Model SHW-CR**

The LM block has tapped holes.

Specification Table⇒A1-144

Note) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

Model number coding

## <u>SHW17 CA 2 QZ UU C1 M +580L P M -II</u>

Model Type of number LM block With QZ Lubricator Contamination protection accessory symbol (\*1)

Stainless steel LM block LM rail length (in mm)

Stainless steel LM rail Symbol for No. of rails used on the same plane (\*4)

L L1

C

No. of LM blocks used on the same rail

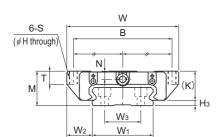

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0) Accuracy symbol (\*3)
Normal grade (No Symbol)/High accuracy grade (H)
Precision grade (P)/Super precision grade (SP)
Ultra precision grade (UP)

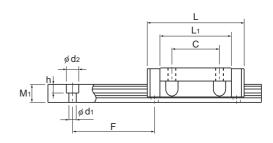

(\*1) See contamination protection accessory on \$\textstyle{1}-510\$. (\*2) See \$\textstyle{1}-70\$. (\*3) See \$\textstyle{1}-77\$. (\*4) See \$\textstyle{1}-13\$.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

Note) If a grease nipple is required, indicate "with grease nipple;" if a greasing hole is required, indicate "with a tapped hole for The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **1-146**.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model SHW variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

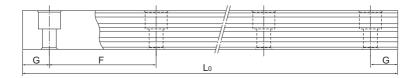

Table1 Standard Length and Maximum Length of the LM Rail for Model SHW

Unit: mm

Note1) The maximum length varies with accuracy grades. Contact THK for details. Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

Note3) Models SHW12, 14 and 17 are made of stainless steel.

# **Greasing Hole**

#### [Grease Nipple and Greasing Hole for Model SHW]

Model SHW does not have a grease nipple as standard. Installation of a grease nipple and the drilling of a greasing hole is performed at THK. When ordering SHW, indicate that the desired model requires a grease nipple or greasing hole. (For greasing hole dimensions and supported grease nipple types and dimensions, see Table2).

When using SHW under harsh conditions, use QZ Lubricator\* (optional) or Laminated Contact Scraper LaCS\* (optional).

Note1) Grease nipple is not available for models SHW12 and SHW14. They can have a greasing hole. Note2) Using a greasing hole other than for greasing may cause damage. Note3) For QZ Lubricator\*, see **\( \bigcirc 1-502 \)**. For Laminated Contact Scraper LaCS\*, see **\( \bigcirc 1-479 \)**.

Note4) When desiring a grease nipple for a model attached with QZ Lubricator, contact THK.

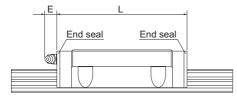

Fig.1 Dimensions of the Grease Nipple for Model SHW

Note) For the L dimension, see the corresponding specifica-

#### Table 2 Table of Grease Nipple and Greasing Hole Dimensions

## **Structure and Features**

Caged Ball LM Guide model SRS has a structure where two raceways are incorporated into the compact body, enabling the model to receive loads in all directions, and to be used in locations where a moment is applied with a single rail. In addition, use of ball cages eliminates friction between balls, thus achieving high speed, low noise, acceptable running sound, long service life, and long-term maintenance-free operation.

#### [Low Dust Generation]

Use of ball cages eliminates friction between balls and retains lubricant, thus achieving low dust gen-eration. In addition, the LM block and LM rail use stainless steel, which is highly resistant to corrosion.

#### [Compact]

Since SRS has a compact structure where the rail cross section is designed to be low and that contains only two rows of balls, it can be installed in space-saving locations.

#### [Lightweight]

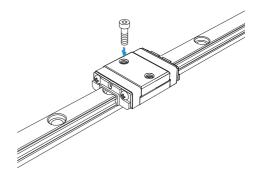

Since part of the LM block (e.g., around the ball relief hole) is made of resin and formed through insert molding, SRS is a lightweight, low inertia type of LM Guide.

# **Types and Features**

# **Model SRS5M**

SRS5 is the smallest caged ball LM guide and its mounting dimensions are interchangeable with the conventional RSR5 model.

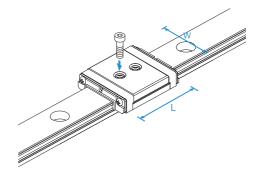

#### Specification Table⇒A1-154

# **Model SRS5WM**

This model has a larger overall LM block length (L), width (W), rated load and permissible moment than model SRS5M. Mounting dimensions are interchangeable with RSR5WM.

#### Specification Table⇒A1-154

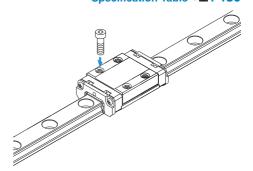

# **Model SRS-M**

A standard type of SRS.

Note) In addition to model SRS-M, a full-ball type without ball cage is also available.If desiring this type, indicate type "SRS-G" when placing an order.However, since SRS-G does not have a ball cage, its dynamic load rating is smaller than SRS-M. See the table of basic load ratings for SRS-G on M1-157 for details.

#### Specification Table⇒A1-156

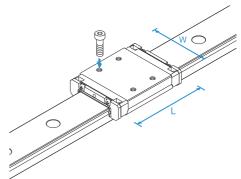

# **Model SRS-WM**

Has a longer overall LM block length (L), a greater width and a larger rated load and permissible moment than SRS-M.

Note) In addition to model SRS-VMI, a full-ball type without ball cage is also available. If desiring this type, indicate type "SRS-G" when placing an order. However, since SRS-G does not have a ball cage, its dynamic load rating is smaller than SRS-VMI. See the table of basic load ratings for SRS-G on M1-159 for details.

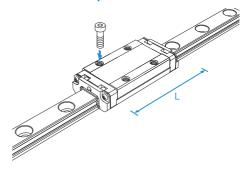

## Specification Table⇒A1-158

## **Model SRS-N**

Compared with model SRS-M, it has a longer total LM block length (L) and a higher load rating and permissible moment.

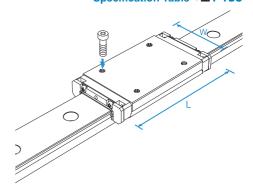

#### Specification Table⇒A1-156

# Model SRS-WN

Compared with model SRS-WM, it has a longer total LM block length (L) and a higher load rating and permissible moment.

#### Specification Table⇒A1-158

# Flatness of the LM Rail and the LM Block Mounting Surface

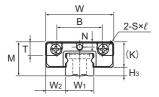

The values in Table1 apply when the clearance is a normal clearance. If the clearance is C1 clearance and two rails are used in combination, we recommend using 50% or less of the value in the table.

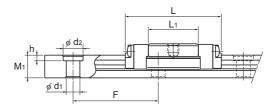

Note) Since SRS has Gothic-arch grooves, any accuracy error in the mounting surface may negatively affect the operation. Therefore, we recommend using SRS on a highly accurate mounting surface. Table1 Flatness of the LM Rail and the LM Block Mounting Surface

Unit: mm

| Model No. | Flatness error |
|-----------|----------------|
| SRS 5     | 0.015/200      |
| SRS 7     | 0.025/200      |
| SRS 9     | 0.035/200      |
| SRS 12    | 0.050/200      |
| SRS 15    | 0.060/200      |
| SRS 20    | 0.070/200      |
| SRS 25    | 0.070/200      |

# Models SRS5M, SRS5WM

SRS5M

| Model No. | Height | Width | Length |   |     |               |                |     |     |      |     |  |
|-----------|--------|-------|--------|---|-----|---------------|----------------|-----|-----|------|-----|--|

Note) Since stainless steel is used in the LM block, LM rail and balls, these models are highly resistant to corrosion and environment.

Model number coding

# +550L

Model number

With QZ Lubricator

Contamination protection accessory symbol (\*1)

LM rail length (in mm)

Stainless steel LM rail

Symbol for No. of rails used on the same plane (\*4)

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1)

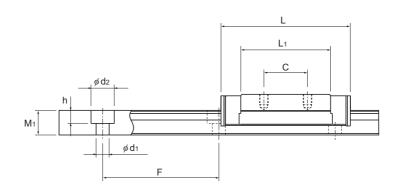

Accuracy symbol (\*3) Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-70. (\*3) See A1-83. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

Unit: mm

Reference bolt tightening torque when mounting an LM block for model SRS 7WM is shown in the table below.
 Reference tightening torque

| Model No. | Model No. of screw | Screw depth (mm) | Reference tightening torque (N•m)* |
|-----------|--------------------|------------------|------------------------------------|
| SRS 7WM   | M3                 | 2.8              | 0.4                                |

<sup>\*</sup> Tightening above the tightening torque affects accuracy. Be sure to tighten at or below the defined tightening torque.

# Standard Length and Maximum Length of the LM Rail

Table2 shows the standard lengths and the maximum lengths of model SRS variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

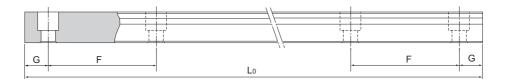

Table2 Standard Length and Maximum Length of the LM Rail for Model SRS

Unit: mm

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

## **Greasing Hole**

#### [Grease Nipple and Greasing Hole for Model SRS]

Model SRS has neither a grease nipple nor a greasing hole as standard. Grease nipple installation and greasing hole drilling are performed at THK. When ordering SRS, indicate that the desired model requires a grease nipple or greasing hole. Model SRS-G (full-ball type) has a grease nipple and a greasing hole as standard (For greasing hole dimensions and supported grease nipple types and dimensions, see Table3).

When using SRS under harsh conditions, use QZ Lubricator\* (optional) or Laminated Contact Scraper LaCS\* (optional).

Note1) Grease nipple is not available for models SR55M, SR55WM, SR57M, SR57WM, SRS9XS, SRS9XM, SRS9XN, SRS9XN,

Note2) Using a greasing hole other than for greasing may cause damage.

Note3) For QZ Lubricator\*, see **\(\Delta\)1-502**. For Laminated Contact Scraper LaCS\*, see **\(\Delta\)1-479**.

Note4) When desiring a grease nipple for a model attached with QZ Lubricator, contact THK.

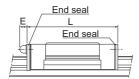

Fig.1 Dimensions of the Grease Nipple for Model SRS

Note) For the L dimension, see the corresponding specification table.

#### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and ball cages and endplates incorporated in the LM block allow the balls to circulate.

This model is an integral type of Caged Ball LM Guide that squares an internal structure similar to model SHS, which has a proven track record and is highly reliable, with another and uses two LM rails in combination. Since an orthogonal LM system can be achieved with model SCR alone, a conventionally required saddle is no longer necessary, the structure for X-Y motion can be simplified and the whole system can be downsized.

#### [4-way Equal Load]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

#### [High Rigidity]

Since balls are arranged in four rows in a well-balanced manner, this model is stiff against a moment, and smooth straight motion is ensured even a preload is applied to increase the rigidity. Since the rigidity of the LM block is higher than that of a combination of two LM blocks of the conventional type secured together back-to-back with bolts, this model is optimal for building an X-Y table that requires a high rigidity.

#### [Compact]

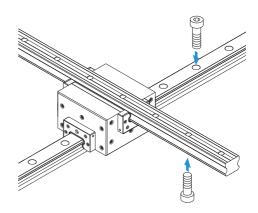

This model is an integral type of Caged Ball LM Guide that squares an internal structure similar to model SHS, which has a proven track record and is highly reliable, with another and uses two LM rails in combination. Since an orthogonal LM Guide can be achieved with model SCR alone, a conventionally required saddle is no longer necessary, the structure for X-Y motion can be simplified and the whole system can be downsized.

# **Types and Features**

# **Model SCR**

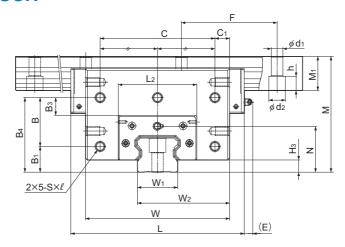

Specification Table⇒▲1-166

This model is a standard type.

# Drawing of Using an Inner Saddle Model SCR can easily be assembled and adjusted by using an inner saddle to link four LM blocks together. When installed on an inner saddle, model SCR achieves a highly accurate X-y guide and high rigidity moment in the yawing direction (as indicated by the arrow in the figure). Inner saddle Ball screw mounting location on the Y axis

Note) Static permissible moment\*: Static permissible moment value with 1 LM block

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard and maximum lengths of the SCR model rail. If a rail length longer than the listed max length is required, rails may be jointed to meet the overall length. Contact THK for details. For special rail lengths, it is recommended to use a value corresponding to the G dimension from the table. As the G dimension increases, this portion becomes less stable and the accuracy performance is severely impacted.

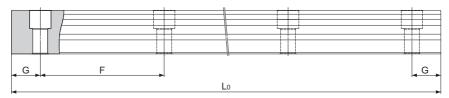

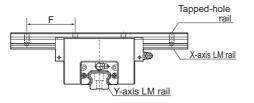

Table1 Standard Length and Maximum Length of the LM Rail for Model SCR

Unit: mm

| Model No.                                       | lodel No. SCR 15                                                                                                                                |                                                                                                                                                                                  | SCR 25                                                                                                                                                                                                           | SCR 30                                                                                                                                                                                                                      | SCR 35                                                                                                                                                                                                                      | SCR 45                                                                                                                                                                                          | SCR 65                       |

# **Tapped-hole LM Rail Type of Model SCR**

The model SCR variations include a type with its LM rail bottom tapped. With the X-axis LM rail having tapped holes, this model can be secured with bolts from the top.

#### Structure and Features

Balls are held in cages with spherical ball holders and the balls roll in four rows of circular-arc grooves in raceways on precision-ground LM rails and LM blocks.

#### [Smooth motion]

Because a finite stroke is used, balls do not circulate and movement is smooth even with pre-loading. Also, because variations in rolling resistance are small, this model is ideal for locations where smooth movement is required with a short stroke.

#### [High Rigidity]

Because model EPF uses a DB construction featuring 4 rows of circular-arc grooves, it offers particularly high rigidity with respect to moment in the Mo direction. This makes it ideal for locations where Mo moment is applied with one rail.

#### [Miniature Type]

Because the mounting method is compatible with the Miniature LM Guide Model RSR-N, the models are dimensionally interchangeable.

#### [4-way Equal Load]

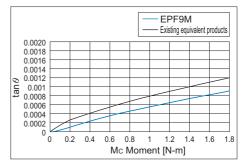

Each row of balls is configured at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the all directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

#### [Ball cage technology application 1]

Because the cage is formed out of plastic resin, there is no metal contact between the cage and the balls, providing excellent noise characteristics, low dust emissions and long product life.

#### [Ball cage technology application 2]

Forming the cage in a spherical shape out of plastic resin allows lubricant to be held in grease pockets, enabling long periods of maintenance-free operation.

# Types and Features

# **Model EPF**

Specification Table⇒A1-174

# **Accuracy of the Mounting Surface**

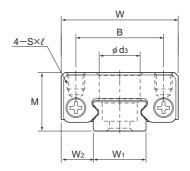

If there is not sufficient precision in the LM rail and LM block mounting surfaces, the product may not function to its full potential. Table 1 Machine to values no higher than those shown in... (Recommended value: 70% of Table 1)

Table1 Flatness of the LM Rail and the LM Block Mounting Surface
Unit: mm

| Model No.  | Flatness error |
|------------|----------------|
| EPF 7M, 9M | 0.015/200      |
| EPF 12M    | 0.025/200      |
| EPF 15M    | 0.035/200      |

Note) It is recommended that highly rigid materials such as iron or cast metal be used as the mounting material. If a material with poor rigidity, such as aluminum, is used, unforeseen loading may be applied to the product. In such situations, contact THK.

Table2 Maximum slip resistance

Unit: N

| Model No. | Maximum slip resistance |
|-----------|-------------------------|
| EPF 7M    | 20                      |
| EPF 9M    | 20                      |
| EPF 12M   | 30                      |
| EPF 15M   | 30                      |

Note) While the cage used to hold the balls is designed to operate extremely precisely, factors such as impacts or inertial moment or drive vibration from the machine

can cause cage distortion.

If using the EPF LM guide in the following conditions, contact THK.

- Vertical Orientation
- Under a large moment load Butting the guide's external stopper with the table
- For applications involving high acceleration/deceleration If cage distortion occurs, the cage must be forcibly restored to its original shape.

Table 1 shows the required slip resistance in this event. Set the thrust so that it is no less than the maximum value shown in the table.

# Standard Length of the LM Rail

Table3 shows the standard LM rail lengths of model EPF.

For special rail lengths, it is recommended to use a value corresponding to the G dimension from the table. As the G dimension increases, this portion becomes less stable and the accuracy performance is severely impacted.

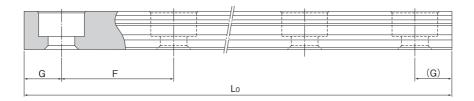

Table3 Standard Length of the LM Rail for Model EPF

Unit: mm

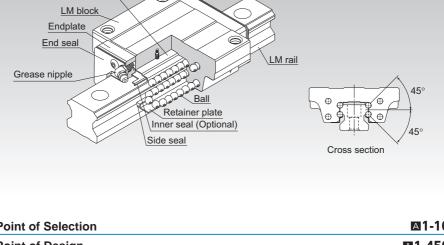

| Model No.                          | EPF 7M | EPF 9M | EPF 12M | EPF 15M |
|------------------------------------|--------|--------|---------|---------|

#### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Since retainer plates hold the balls, they do not fall off even if the LM rail is pulled out (except models HSR 8, 10 and 12).

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations. In addition, the LM block can receive a well-balanced preload, increasing the rigidity in the four directions while maintaining a constant, low friction coefficient. With the low sectional height and the high rigidity design of the LM block, this model achieves highly accurate and stable straight motion.

#### [4-way Equal Load]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

#### [High Rigidity Type]

Since balls are arranged in four rows in a well-balanced manner, a large preload can be applied and the rigidity in four directions can easily be increased.

#### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

#### [High Durability]

Even under a preload or excessive biased load, differential slip of balls does not occur. As a result, smooth motion, high wear resistance, and long-term maintenance of accuracy are achieved.

#### [Stainless Steel Type also Available]

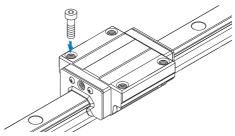

A special type which LM block, LM rail and balls are made of stainless steel is also available.

# **Types**

# **Model HSR-A**

The flange of its LM block has tapped holes.

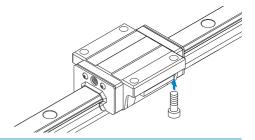

# Specification Table⇒**△1-184**

# **Model HSR-B**

The flange of the LM block has through holes. Used in places where the table cannot have through holes for mounting bolts.

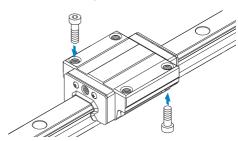

#### Specification Table⇒A1-186

# **Model HSR-C Grade Ct**

The flange of its LM block has tapped holes. Can be mounted from the top or the bottom.

## Specification Table⇒A1-188

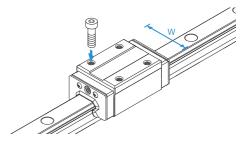

# **Model HSR-R**

Having a smaller LM block width (W) and tapped holes, this model is optimal for compact design.

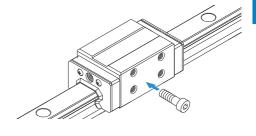

Low-priced LM rails and LM blocks are individually stocked. We also have Ct grade model HSR-R available with a short delivery time.

#### Specification Table⇒A1-192

### **Model HSR-YR**

When using two units of LM Guide facing each other, the previous model required much time in machining the table and had difficulty achieving the desired accuracy and adjusting the clearance. Since model HSR-YR has tapped holes on the side of the LM block, a simpler structure is gained and reduced man-hour and increase in accuracy can be achieved.

Specification Table⇒A1-196

Fig.1 Conventional Structure

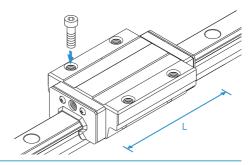

Fig.2 Mounting Structure for Model HSR-YR

#### **Model HSR-LA**

The LM block has the same cross-sectional shape as model HSR-A, but has a longer overall LM block length (L) and a greater rated load.

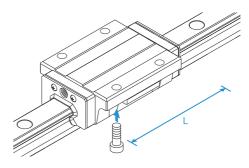

#### Specification Table⇒A1-184

# **Model HSR-LB**

The LM block has the same cross-sectional shape as model HSR-B, but has a longer overall LM block length (L) and a greater rated load.

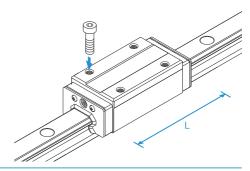

#### Specification Table⇒▲1-186

# **Model HSR-LR**

The LM block has the same cross-sectional shape as model HSR-R, but has a longer overall LM block length (L) and a greater rated load.

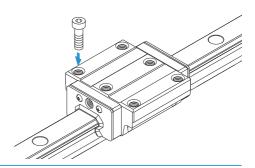

#### Specification Table⇒▲1-192

### **Model HSR-CA**

Has six tapped holes on the LM block.

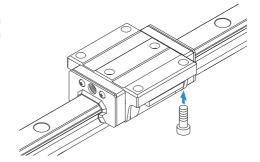

Specification Table⇒A1-198

# **Model HSR-CB**

The LM block has six through holes. Used in places where the table cannot have through holes for mounting bolts.

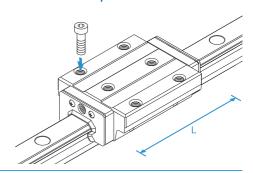

Specification Table⇒**△1-200** 

### **Model HSR-HA**

The LM block has the same cross-sectional shape as model HSR-CA, but has a longer overall LM block length (L) and a greater rated load.

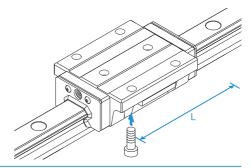

#### Specification Table⇒▲1-198

#### **Model HSR-HB**

The LM block has the same cross sectional shape as model HSR-CB, but has a longer overall LM block length (L) and a greater rated load.

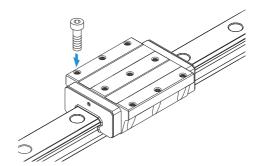

#### Specification Table⇒A1-200

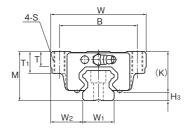

# Models HSR 100/120/150 HA/HB/HR

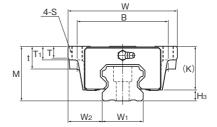

Large types of model HSR that can be used in large-scale machine tools and building structures.

#### Specification Table⇒A1-202

Note) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

The maximum length under "Length" indicates the standard maximum length of an LM rail. (See M1-204.)

Static permissible moment": 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

#### Model number coding

Model

#### C0 M +1200L P HSR25 QZ UU

Type of LM block number

With QZ Contamination Lubricator protection accessory symbol (\*1)

Stainless steel LM rail length LM block (in mm)

Stainless steel LM rail Symbol for LM rail jointed use

Accuracy symbol (\*3)

Symbol for No. of rails used on the same plane (\*4)

No. of LM blocks used on the same rail Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

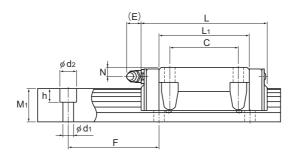

Normal grade (No Symbol)/High accuracy grade (H)
Precision grade (P)/Super precision grade (SP)
Ultra precision grade (UP)

(\*1) See contamination protection accessory on 1-510. (\*2) See 1-71. (\*3) See 1-77. (\*4) See 1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)
Those models equipped with QZ Lubricator cannot have a grease nipple.

Note) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-204.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

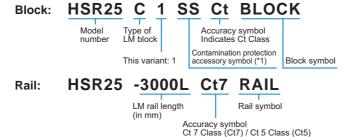

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

Note) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See 

1-204.) Static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Model number coding

#### UU C0 M +1200L HSR25 YR

Model number Type of LM block

Contamination protection accessory symbol (\*1)

Stainless steel LM block

Medium preload (C0)

LM rail length (in mm)

Stainless steel LM rail Symbol for LM rail plane (\*4) jointed use

Symbol for No. of rails used on the same

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1)

Accuracy symbol (\*3)

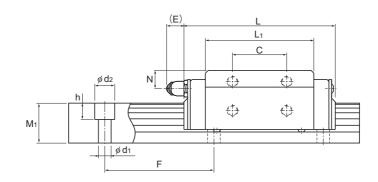

Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-71. (\*3) See A1-77. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

To download a desired data, search for the corresponding model number in the Technical site

Note) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

The maximum length under "Length" indicates the standard maximum length of an LM rail. (See 

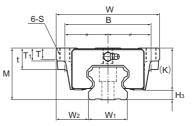

1 block: static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

#### Model number coding

#### **HSR25** KKHH C0 M +1300L HA QΖ

Model number

Type of LM block

No. of LM blocks

used on the same

With QZ Lubricator

Contamination protection accessory symbol (\*1)

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

Stainless steel LM rail length LM block (in mm)

> Accuracy symbol (\*3) Normal grade (No Symbol) High accuracy grade (H) Precision grade (P) Super precision grade (SP) Ultra precision grade (UP)

Stainless steel LM rail

Symbol Symbol for for LM rail jointed use

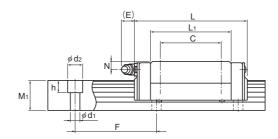

No. of rails used on the same plane (\*4)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-71. (\*3) See A1-77. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.) Those models equipped with QZ Lubricator cannot have a grease nipple.

rail

Model number coding

#### **ZZHH** M HSR35 CB QΖ C<sub>0</sub> +1400L

Model number

Type of LM block

No. of LM blocks

used on the same

With QZ Lubricator Contamination protection accessory symbol (\*1)

Radial clearance symbol (\*2)

LM block

Stainless steel LM rail length (in mm)

Accuracy symbol (\*3) Normal grade (No Symbol) High accuracy grade (H) Precision grade (P) Super precision grade (SP) Ultra precision grade (UP) Stainless steel LM rail

Symbol for Symbol No. of rails used for LM rail on the same jointed use plane (\*4)

(\*1) See contamination protection accessory on △1-510. (\*2) See △1-71. (\*3) See △1-77. (\*4) See △1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

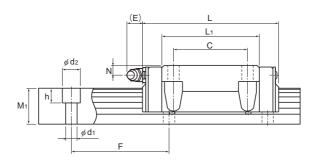

Normal (No symbol)

Medium preload (C0)

Light preload (C1)

Note) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

The maximum length under "Length" indicates the standard maximum length of an LM rail. (See \( \bigcite{\textit{\textit{M}}} \) 1.3 table blocks static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **1-204**.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block
Double blocks: static permissible moment value with 2 blocks closely contacting with each other

### Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model HSR variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

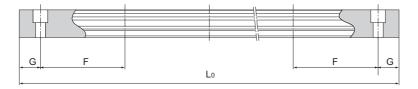

Table1 Standard Length and Maximum Length of the LM Rail for Model HSR

Unit: mm

| Model No.                    | HSR 8                                                                        | HSR 10                                                                                                    | HSR 12                                                 | HSR 15                                                                  | HSR 20                                                                                       | HSR 25                                                                                                                 | HSR 30                                                                                                             | HSR 35                                                                                                       | HSR 45                                                                                                                                                                   | HSR 55                                                                                                                             | HSR 65                                 | HSR 85                                 | HSR 100                      | HSR 120                         | HSR 150                         |

Note1) The maximum length varies with accuracy grades. Contact THK for details.

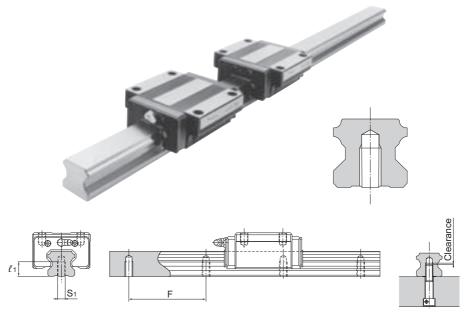

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

Note3) The figures in the parentheses indicate the maximum lengths of stainless steel made models.

Note4) The LM rail standard lengths appearing in dimmed text for models HSR 15 to HSR 35 are not available as standard for Ct7 and Ct5 grades. If desiring a length in dimmed text, contact THK.

# Tapped-hole LM Rail Type of Model HSR

HSR model rails also include a type where the LM rail is tapped from the bottom. This type is useful when mounting from the bottom of the base and when increased contamination protection is desired.

- (1) Determine the bolt length so that a clearance of 2 to 5 mm is secured between the bolt end and the bottom of the tap (effective tap depth). (See figure above.)
- (2) A tapped-hole LM rail type is available also for model HSR-YR.
- (3) For standard pitches of the taps, see Table1 on A1-204.

Table2 Dimensions of the LM Rail Tap

Unit: mm

| Model No. | S <sub>1</sub> | Effective tap depth $\ell_1$ |
|-----------|----------------|------------------------------|
| HSR 15    | M5             | 8                            |
| HSR 20    | M6             | 10                           |
| HSR 25    | M6             | 12                           |
| HSR 30    | M8             | 15                           |
| HSR 35    | M8             | 17                           |
| HSR 45    | M12            | 24                           |
| HSR 55    | M14            | 24                           |

Model number coding

# HSR30A2UU +1000LH K

Symbol for tapped-hole LM rail type

Note) Ct7 and Ct5 grades are not applicable.

## **Stopper**

In miniature model HSR, the balls fall out if the LM block comes off the LM rail.

For this reason, they are delivered with a stopper fitted to prevent the LM block coming off the rail. If you remove the stopper when using the product, take care to ensure that overrun does not occur.

Table3 Model HSR stopper (C type) specification table

Unit: mm

| Model No. | Α  | В | С  |
|-----------|----|---|----|
| 8         | 13 | 6 | 10 |

#### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since a retainer plate holds the balls, they will not fall off even if the LM block is removed from the LM rail. With the low sectional height and the high rigidity design of the LM block, this model achieves highly accurate and stable straight motion.

#### [Compact, Heavy Load]

Since it is a compact designed model that has a low sectional height and a ball contact structure rigid in the radial direction, this model is optimal for horizontal guide units.

#### [Mounting accuracy can easily be achieved]

Since this model is a self-adjusting type capable of easily absorbing an accuracy error in parallelism and level between two rails, highly accurate and smooth motion can be achieved.

#### [Low Noise]

The endplate installed at each end of the LM block is designed to ensure the smooth and low-noise circulation of the balls at the turning areas.

#### [High Durability]

Even under a preload or excessive biased load, differential slip of balls is minimal. As a result, high wear resistance and long-term maintenance of accuracy are achieved.

#### [Stainless Steel Type also Available]

A special type which LM block, LM rail and balls are made of stainless steel is also available.

# **Types and Features**

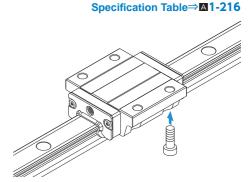

## **Model SR-W**

With this type, the LM block has a smaller width (W) and tapped holes.

Specification Table⇒A1-214

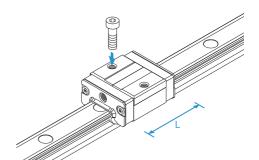

### **Model SR-TB**

The LM block has the same height as model SR-W and can be mounted from the bottom.

# **Model SR-V**

A space-saving type whose LM block has the same cross-sectional shape as model SR-W, but has a smaller overall LM block length (L).

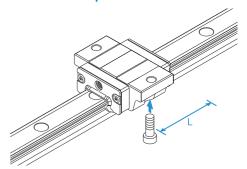

# Specification Table⇒△1-214

# **Model SR-SB**

A space-saving type whose LM block has the same cross-sectional shape as model SR-TB, but has a smaller overall LM block length (L).

#### Specification Table⇒A1-216

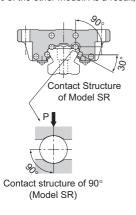

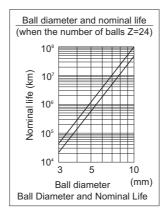

#### **Characteristics of Model SR**

When compared to models having a contact angle of 45°, model SR shows excellent characteristics as indicated below. Using these characteristics, you can design and manufacture highly accurate and highly rigid machines or equipment.

#### Difference in Rated Load and Service Life

Since SR has a contact angle of 90°, its rated load and service life are different from those with a contact angle of 45°. When comparing model SR with a model that has a contact angle of 45° and when the same radial load is applied to the two models with the same ball diameter as shown in the figure below, the load applied to SR is 70% of the other model. As a result, the service life of SR is more than twice that of the other model.

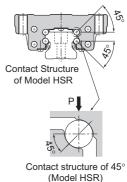

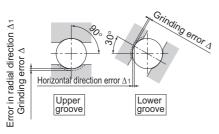

Fig.1

#### **Difference in Accuracy**

If a machining error (grinding error) occurs in the LM rail or LM block, it will affect the running accuracy. Assuming that there is a machining error of  $\Delta$  on the raceway, it results in an error in the radial direction, and the error with the contact angle of  $45^\circ$  (model HSR) is 1.4 times greater than that of the contact angle of  $90^\circ$  (model SR). As for the machining error resulting in horizontal direction error, the error with the contact angle of  $45^\circ$  is 1.22 times greater than the contact angle of  $30^\circ$ .

Contact structure of 90° (Model SR)

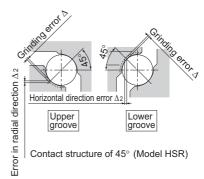

Fig.2 Machining Error and Accuracy

#### **Difference in Rigidity**

The 90° contact angle adopted by model SR has a difference with the 45° contact angle also in rigidity. When the same radial load "P" is applied, the displacement in the radial direction with model SR is only 56% of that with the contact angle of 45°. Accordingly, where high rigidity in the radial direction is required, model SR is more advantageous. The figure below shows the difference in radial load and displacement.

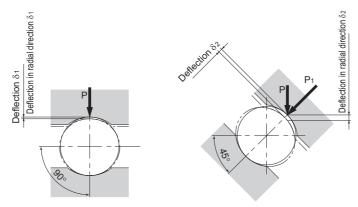

Fig.3 Deflection under a Radial Load

Load and deflection when contact angles are not the same (Da=6.35mm)

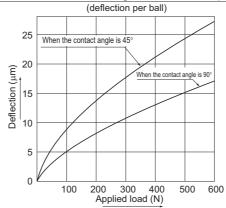

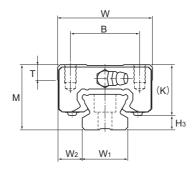

Fig.4 Radial Load and Deflection

#### Conclusion

Model SR with this type of 90° contact construction are ideal for locations where the load applied is mostly radial, locations where radial rigidity is required, and locations where accurate motion is demanded in the up, down, left and right directions.

However, if the reverse radial load, the lateral load or the moment is large, we recommend model HSR, which has a contact angle of 45° (4-way equal load).

Note1) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

Those model numbers including and greater than SR85T are semi-standard models. If desiring these models, contact THK.

Models SR85T and SR100T are equipped with grease nipple on the side face of the LM block.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See 

1-218.)

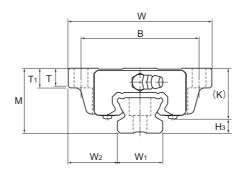

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other Note2) For models SR15 and 25, two types of rails with different mounting hole dimensions are offered (see Table1). When, replacing this model with model SSR, pay attention to the mounting hole dimension of the LM rail. Contact THK for details.

Note) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

# Model number coding SR25 TB

# TB 2 UU C1 +1200L Y H T - II

Model Type of number LM block

Contamination protection accessory symbol (\*1)

LM rail length (in mm) Applied to only 15 and 25

Symbol for LM rail jointed use

Symbol for No. of rails used on the same plane (\*4)

No. of LM blocks used on the same

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

Accuracy symbol (\*3)

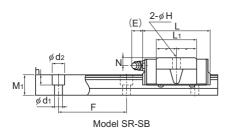

Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

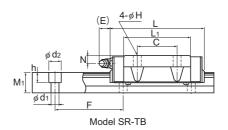

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-71. (\*3) See A1-77. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Note1) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-218.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with

each other

Note2) For models SR15 and 25, two types of rails with different mounting hole dimensions are offered (see Table1).

When, replacing this model with model SSR, pay attention to the mounting hole dimension of the LM rail.

Contact THK for details.

Table1 The dimension of the rail mounting hole

| Model No. | Standard rail      | Semi-Standard rail |
|-----------|--------------------|--------------------|
| SR 15     | For M3 (No symbol) | For M4 (Symbol Y)  |
| SR 25     | For M6 (Symbol Y)  | For M5 (No symbol) |

### Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model SR variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

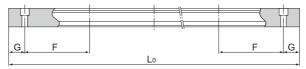

Table1 Standard Length and Maximum Length of the LM Rail for Model SR

Unit: mm

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

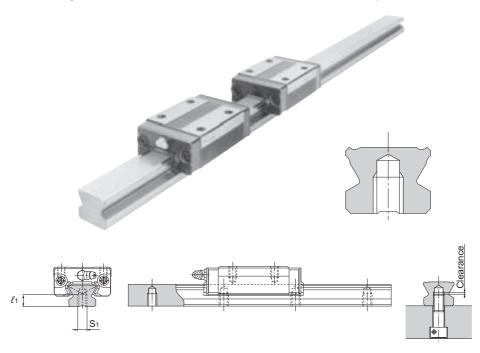

Note3) Those model numbers including and greater than SR85T are semi-standard models. If desiring these models, contact THK.

Note4) The figures in the parentheses indicate the maximum lengths of stainless steel made models.

### **Tapped-hole LM Rail Type of Model SR**

SR model rails also include a type where the LM rail is tapped from the bottom. This type is useful when mounting from the bottom of the base and when increased contamination protection is desired.

- (1) A tapped-hole LM rail type is available only for high accuracy or lower grades.
- (2) Determine the bolt length so that a clearance of 2 to 5 mm is secured between the bolt end and the bottom of the tap (effective tap depth). (See figure above.)
- (3) For standard pitches of the taps, see Table1 on M1-218.

Table2 Dimensions of the LM Rail Tap Unit: mm

| Model No. | S <sub>1</sub> | Effective tap depth $\ell_1$ |

### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. The raceways are cut into deep grooves that have a radius closer to that of the balls than in the conventional design, using special equipment and an extremely precise cutting technique. This design allows high rigidity, high vibration/impact resistance and high damping capacity, all of which are required for machine tools, thus making these models capable of bearing ultra-heavy loads.

\* Due to the extremely high rigidity of the LM guides used in models NR/NRS, the construction does not easily absorb the effects of mounting surface misalignment and installation errors. Where such effects arise, there is a risk of reduced operating life and/or malfunction. Contact THK when considering the use of these products.

### [Improved Damping Capacity]

While the machine tool (equipped with NR or NRS) is not cutting a workpiece during operation, the LM Guide travels normally and smoothly. While the machine tool is cutting the workpiece, the cutting force is applied to the LM Guide to increase and the contact area between the balls and the raceway, allowing an appropriate mixture of rolling and sliding motions to be achieved. Accordingly, the friction resistance is increased and the damping capacity is improved.

Since the absolute slip during the rolling and sliding motion is insignificant, it causes little wear and does not affect the service life.

### [Highly Rational LM Guide]

The excessively large differential slip occurring in a Gothic-arch groove does not happen with these models. They smoothly travel and achieve high positioning accuracy during fast feeding. During the cutting operation, appropriate slip occurs according to the cutting load, the rolling resistance is increased and the damping capacity is increased. Thus, models NR and NRS are highly rational LM Guides.

### [High Rigidity]

To increase the rigidity of the LM block and the LM rail, which may deteriorate the overall rigidity of the LM Guide in the reverse radial and lateral directions, THK made full use of FEM to achieve optimal design within the limited dimensional range.

THK provides two identically sized models with different characteristics, namely the radial model NR and four-way equal-load model NRS, users can select the model that best suits their specifications.

### [Ultra-heavy Load]

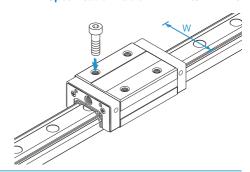

Since the curvature of the raceway is approximated to the ball diameter, the ball contact area under a load is increased and the LM Guide is capable of receiving an ultra-heavy load.

### **Types and Features**

### Models NR-R/NRS-R

With this type, the LM block has a smaller width (W) and tapped holes. Used in places where the space for table width is limited.

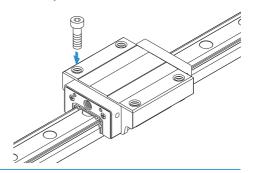

### Specification Table⇒A1-226/A1-228

### **Models NR-A/NRS-A**

The flange of its LM block has tapped holes.

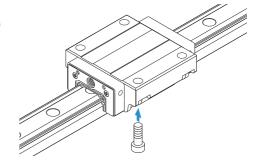

Specification Table⇒A1-230/A1-232

### **Models NR-B/NRS-B**

The flange of the LM block has through holes. Used in places where the table cannot have through holes for mounting bolts.

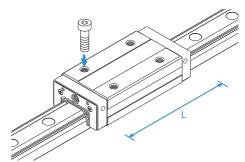

Specification Table⇒A1-234/A1-236

### Models NR-LR/NRS-LR

The LM block has the same cross-sectional shape as models NR-R/NRS-R, but has a longer overall LM block length (L) and a greater rated load.

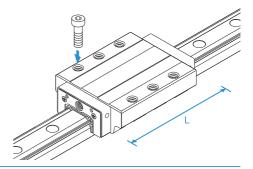

### Specification Table⇒A1-226/A1-228

### Models NR-LA/NRS-LA

The LM block has the same cross-sectional shape as models NR-A/NRS-A, but has a longer overall LM block length (L) and a greater rated load.

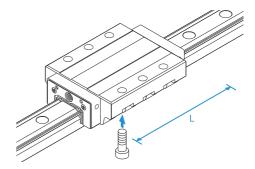

Specification Table⇒A1-230/A1-232

### Models NR-LB/NRS-LB

The LM block has the same cross-sectional shape as models NR-B/NRS-B, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒A1-234/A1-236

### **Characteristics of Models NR and NRS**

### [Increased Rigidity in Major Load Directions]

The structure with a contact angle of  $90^{\circ}$  used in model NR differs from that with a  $45^{\circ}$  contact angle also in rigidity. Under the same radial load P, the displacement in the radial direction with model NR having a contact angle of  $90^{\circ}$  is 44% less than the  $45^{\circ}$ .

Fig.2 shows the difference in radial load and displacement. Accordingly, where high rigidity in the radial direction is required, model NR is more advantageous.

# Contact structure of 90° Contact structure of 90° Contact structure of 45° (Model NR)

Fig.1 Deflection under a Radial Load

### Load and deflection when contact angles are not the same (Da=6.35mm)

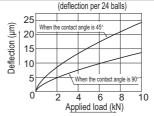

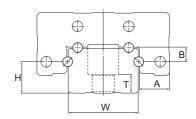

Fig.2 Radial Load and Deflection (normal clearance, no preload)

# [Increased Rigidity in the Lateral and Reverse-radial Directions]

Since with LM Guide model NR, the distance "H" between the rail bottom and the lower-groove balls (balls receiving lateral loads) is short, the ratio between the rail width "W" and the distance "H" is small, and the distance "T" between the LM rail mounting bolt seat and the LM rail bottom is short. Accordingly, the deformation of the LM rail under a lateral load is minimal, and the rigidity in the lateral directions is increased. Since the dimension "B" of the LM block is short and the thickness "A" is large, the lateral extension of the LM block under a reverse radial or lateral load is minimized. This structure allows the rigidity in the reverse radial direction to be increased.

In comparison to the old model with the same model number, the ball diameter of NR is smaller and the number of effective balls is approximately 1.3 times greater, thus increasing the static rigidity.

Radial type structure
Fig.3 Cross Section of Model NR

### [Comparison of Contact Surface and Internal Stress between Different Contact Structures]

As shown in Fig.4, the contact area and the internal stress of a ball greatly vary depending on the shape of contact surface.

With the conventional roller guide, the effective length is shorter than the apparent value due to the retention of the rollers. Additionally, the change of stress distribution in the contact section caused by a mounting error significantly affects the differential slip.

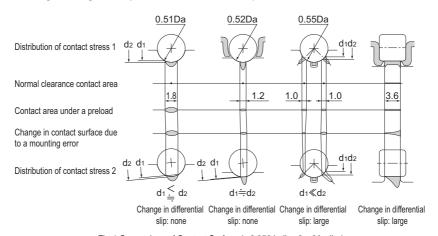

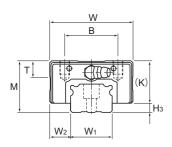

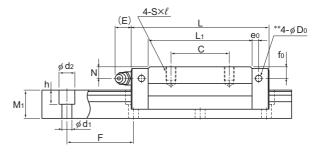

Fig.4 Comparison of Contact Surface ( $\phi$  6.350 ball,  $\phi$  6 x 6 $\ell$  roller)

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product.

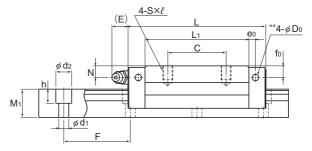

THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other than mounting a grease nipple.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-238.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

### Model number coding

### NRS45 LR 2 QZ ZZHH C0 +1200L P Z T - II

Model number Type of LM block With QZ Lubricator Contamination protection accessory symbol (\*1)

LM rail length (in mm)

Symbol for LM rail jointed use With plate cover or steel tape (\*4) Symbol for No. of rails used on the same plane (\*5)

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol)/Light preload (C1) Medium preload (C0)

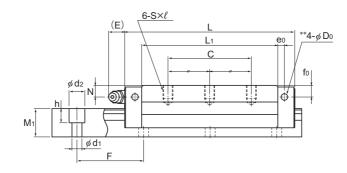

Accuracy symbol (\*3) Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

(\*1) See contamination protection accessory on A1-510 (\*2) See A1-70. (\*3) See A1-77. (\*4) Specify the plate cover or the steel tape. (\*5) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple

Model NRS-LR

### Model number coding

### NR35 A 2 QZ KKHH C0 +1400L P Z T -II

Model number

Type of LM block With QZ Lubricator Contamination protection accessory symbol (\*1)

LM rail length (in mm)

Symbol for LM rail jointed use With plate cover or steel tape (\*4) Symbol for No. of rails used on the same plane (\*5)

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

Accuracy symbol (\*3)

Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

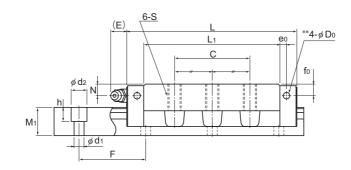

(\*1) See contamination protection accessory on \$\textstyle{\textstyle{100}}\$ 1-510 (\*2) See \$\textstyle{\textstyle{100}}\$ 1-70. (\*3) See \$\textstyle{\textstyle{100}}\$ 1-77. (\*3) See \$\textstyle{\textstyle{100}}\$ 1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

Model NR-LA

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product.

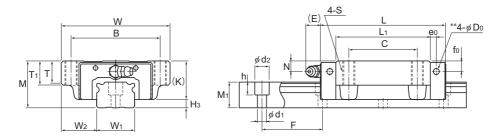

THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other than mounting a grease nipple.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-238.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product.

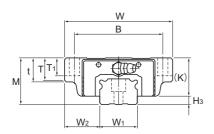

THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other than mounting a grease nipple.

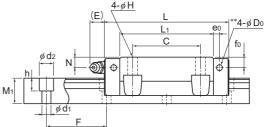

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-238.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

### Models NR-B and NR-LB

### Model number coding

NR35 B 2 QZ DDHH C0 +1080L P Z T - I

Model number Type of LM block

With QZ Lubricator

Contamination protection accessory symbol (\*1)

LM rail length (in mm)

Symbol for LM rail jointed use With plate cover or steel tape (\*4) Symbol for No. of rails used on the same plane (\*5)

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1)

Light preload (C1) Accura Medium preload (C0) Norma

Accuracy symbol (\*3) Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

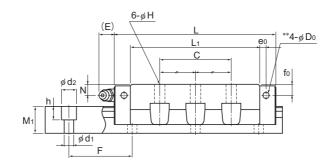

(\*1) See contamination protection accessory on \$\textstyle{\textstyle{100}}\text{ 1-510}\$ (\*2) See \$\textstyle{\textstyle{1-70}}\text{ (\*3) See \$\textstyle{\textstyle{1-70}}\text{ (\*5) See \$\textstyle{\textstyle{1-13}}\text{ ...}\$

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

### Model NR-LB

Unit: mm

### Model number coding

number

### **KKHH** C0 +2040L NRS45 В QΖ Contamination With QZ Model Type of

LM block

protection Lubricator accessory symbol (\*1)

LM rail length (in mm)

Symbol for LM rail iointed use With plate cover or Symbol for No. of rails used on the same plane (\*5)

No. of LM blocks used on the same rail Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1)

Medium preload (C0)

steel tape (\*4)

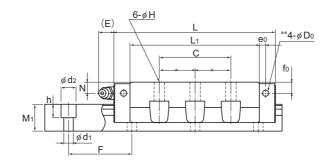

Accuracy symbol (\*3) Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

(\*1) See contamination protection accessory on A1-510 (\*2) See A1-70. (\*3) See A1-77. (\*4) Specify the plate cover or the steel tape. (\*5) See **A1-13**.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)
Those models equipped with QZ Lubricator cannot have a grease nipple.

Note) Pilot holes for side nipples\*\* are not drilled through in order to prevent foreign material from entering the product. THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes\*\* for purposes other The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **1-238**.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

### Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of models NR/NRS variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

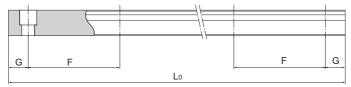

Table1 Standard Length and Maximum Length of the LM Rail for Models NR/NRS

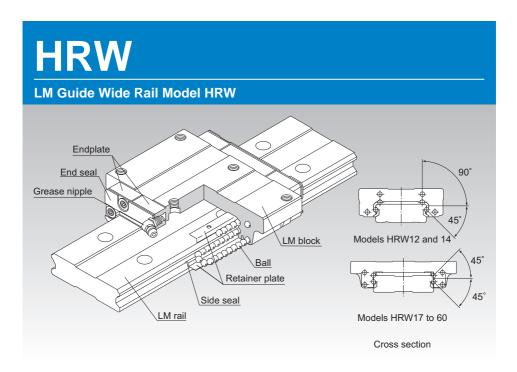

Unit: mm

| Model No.         | NR/NRS25X | NR/NRS30 | NR/NRS35 | NR/NRS45 | NR/NRS55 | NR/NRS65 | NR/NRS75 | NR/NRS85 | NR/NRS100 |

## A1-240 冗比以

### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Since retainer plates hold the balls, they do not fall off even if the LM rail is pulled out. (except models HRW 12 and 14LR).

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations. In addition, the LM block can receive a well-balanced preload, increasing the rigidity in four directions while maintaining a constant, low friction coefficient. In a low center of gravity structure with a large rail width and a low overall height, this model can be used in places where space saving is required or high rigidity against a moment is required even in a single axis configuration.

### [Compact, Heavy Load]

Since the number of effective balls is large, this model is highly rigid in all directions. It can adequately receive a moment even in a single rail configuration.

Additionally, since the second moment of inertia of the rail is large, the rigidity in the lateral directions is also high. Accordingly, it does not need reinforcement such as a side support.

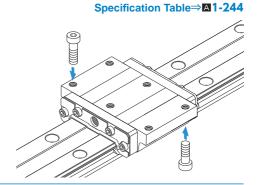

### [Self-adjustment Capability]

The self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus to achieve highly accurate, smooth straight motion.

### **Types and Features**

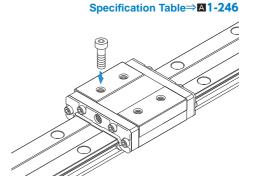

### **Model HRW-CA**

The flange of this LM block has tapped holes. Can be mounted from the top or the bottom.

### **Model HRW-CR**

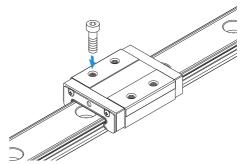

The LM block has tapped holes.

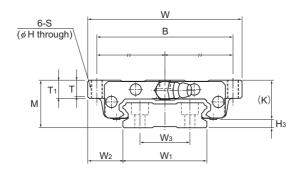

### **Miniature Type Model HRW-LRM**

The LM block has tapped holes.

### Models HRW-CA and HRW-CAM

### Standard Length and Maximum Length of the LM Rail

Table1 shows the standard and maximum lengths of the HRW model rail. If a rail length longer than the listed max length is required, rails may be jointed to meet the overall length. Contact THK for details. For special rail lengths, it is recommended to use a value corresponding to the G dimension from the table. As the G dimension increases, this portion becomes less stable and the accuracy performance is severely impacted. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

| Max length        | (1000) | (1430) | 1900<br>(800) | 1900<br>(1000) | 3000<br>(1200) | 3000   | 3000   | 3000   |

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

Note3) The figures in the parentheses indicate the maximum lengths of stainless steel made models.

### Stopper

In miniature model HRW, the balls fall out if the LM block comes off the LM rail.

For this reason, they are delivered with a stopper fitted to prevent the LM block coming off the rail. If you remove the stopper when using the product, take care to ensure that overrun does not occur.

### Structure and Features

With models RSR and RSR-W, balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Since balls circulate in a compact structure, the LM Block is able to provide infinite straight motion and thus infinite stroke.

The LM block is designed to have a shape with high rigidity in a limited space, and in combination with large-diameter balls, demonstrates high rigidity in all directions.

### [Ultra Compact]

The absence of cage displacement, a problem that cross-roller guides and types of ball slides with finite stroke tend to cause, make these models highly reliable LM systems.

### [Capable of Receiving Loads in All Directions]

These models are capable of receiving loads in all directions, and a single-rail guide can adequately operate under a small moment load. Model RSR-W, in particular, has a greater number of effective balls and a broader LM rail to increase its rigidity against a moment. Thus, it achieves a more compact structure and more durable straight motion than a pair of linear bushes in parallel use.

### [Stainless Steel Type also Available]

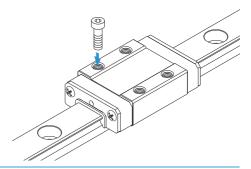

A special type where LM block, LM rail and balls are made of stainless steel is also available.

### **Types and Features**

### Models RSR-M/RSR-KM/RSR-VM

Specification Table⇒A1-258

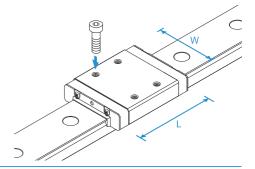

This model is a standard type.

### Models RSR-WM/WV/WVM

These models have greater overall LM block lengths (L), broader widths (W) and greater rated loads and permissible moments than standard types.

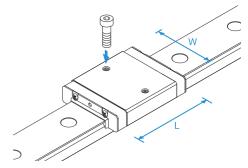

### Specification Table⇒A1-260

### **Model RSR-WTM**

Has position of LM block mounting holes changed compared with RSR-WM.

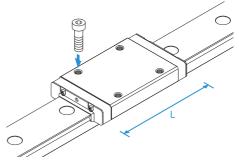

### Specification Table⇒A1-260

## **Model RSR-N**

It has a longer overall LM block length (L) and a greater rated load than standard types.

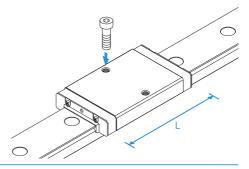

# Specification Table⇒**▲1-256**

## **Model RSR-TN**

Has position of LM block mounting holes changed compared with RSR-N.

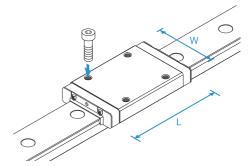

## Specification Table⇒▲1-256

## Models RSR-WN/WTN

It has a longer overall LM block length (L), a greater rated load than standard types. Achieves the greatest load capacity among the miniature type LM Guide models.

## Specification Table⇒▲1-260

## Comparison of Model RSR-W with Other Model Numbers

## [Locations where a Pair of Linear Bushes are Used]

- Unlike the linear bushes, model RSR-W can be used in a single-rail configuration and allows space saving.
- Since model RSR-W has more load-bearing balls per row and wider LM block and LM rail, thus to achieve high rigidity against an overhung load.
- Accuracy can be achieved simply by mounting the LM rail using bolts. Therefore, the assembly time can be shortened.

## Example of comparing model RSR12W with model LM 10 in use

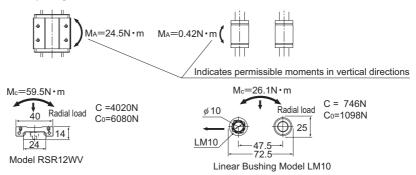

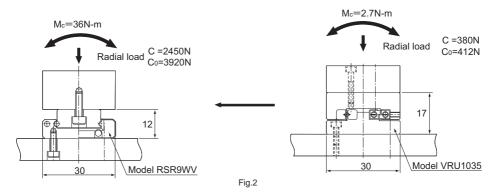

Fig.1

## [Locations where a Cross-roller Table is Used]

- Does not show cage displacement even with vertical mount, and capable of performing infinite straight motion.
- Eliminates the need for difficult clearance adjustment and achieves long-term, smooth motion over a long period of time.
- Since the LM block width is large, the model can be used as a miniature table without any modification.

#### Example of comparing model RSR9WV with model VRM1035 in use

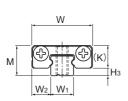

# **Accuracy of the Mounting Surface**

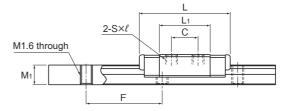

Model RSR uses Gothic arch grooves in the ball raceways. When two rails of RSR are used in parallel, any error in accuracy of the mounting surface may increase rolling resistance and negatively affect the smooth motion of the guide. For specific accuracy of the mounting surface, see [Flatness of the Mounting Surface] on **A1-468**.

When using this model in locations where it is difficult to obtain satisfactory accuracy of the mounting surface, we recommend using types RSR···A (semi standard) whose ball raceways have circular-arc grooves. (avoid using these types in a single-rail configuration).

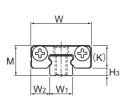

For specific accuracy of the mounting surface for types RSR···A, [Flatness of the Mounting Surface] is on **A1-468**.

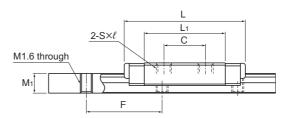

## Models RSR-M, RSR-N and RSR-TN

Note) Since stainless steel is used in the LM block, LM rail and balls, these models are highly resistant to corrosion and environment. Models RSR3M and 3N do not have an oil hole. When lubricating them, apply a lubricant directly to the LM rail raceways. No contamination protection seal for RSR3M/3N.

To secure the LM rail of models RSR5M and 5N, use cross-recessed head screws for precision equipment (No. 0 pan head screw, class 1) M2.

#### Model number coding

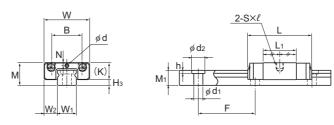

RSR5 M +130L Model number Contamination LM rail length Stainless Symbol for protection (in mm) steel No. of rails used accessory symbol (\*1) LM rail on the same plane (\*4) No. of LM blocks Radial clearance symbol (\*2) used on the same rail Accuracy symbol (\*3) Normal (No symbol) Normal grade (No Symbol)/Precision grade (P) Light preload (C1)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-71. (\*3) See A1-83. (\*4) See A1-13.

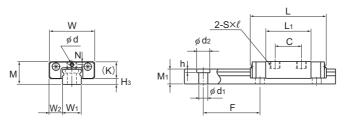

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Recommended tightening torque when mounting the LM rail/block

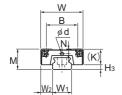

Table1 shows recommended bolt tightening torques when mounting the LM block and LM rail of models RSR3M/3N.

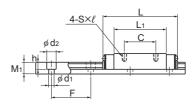

Table1 Recommended Tightening Torques of Mounting Bolts

| Model No. of screw | Recommended tightening torque (N-m) |
|--------------------|-------------------------------------|
| M1.6               | 0.09                                |
| M2                 | 0.19                                |

Note) Applicable to austenite stainless steel hexagonal-socket-head type bolts.

Note) Since stainless steel is used in the LM block, LM rail and balls, these models are highly resistant to corrosion and environment.

#### Model number coding

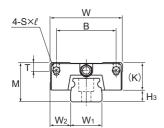

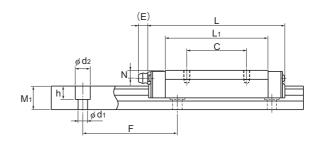

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-71. (\*3) See A1-83. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

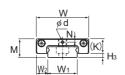

#### Models RSR15 and 20VM/N

Note1) The maximum length varies with accuracy grades. Contact THK for details. Note2) The LM rail mounting hole of model RSR3 is an M1.6 through hole.

## **Stopper**

In model RSR/RSR-W, the balls fall out if the LM block comes off the LM rail.

For this reason, they are delivered with a stopper fitted to prevent the LM block coming off the rail. If you remove the stopper when using the product, take care to ensure that overrun does not occur.

Table3 Model RSR/RSR-W stopper (C type) specification table

Unit: mm

|           |      |   | Offic. Hilli |
|-----------|------|---|--------------|

## **Structure and Features**

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Balls of model RSR-Z circulate in a compact structure and perform infinite straight motion with no limit in stroke.

Also, it has the same dimensions as models RSR/RSR-W, but achieves a lighter weight and a lower price.

## [Lightweight]

Since part of the LM block body uses a resin material, the block mass is reduced by up to 28% from the conventional type model RSR-V. This makes RSR-Z a low-inertia type.

## [Smooth Motion]

The unique structure of the endplate allows the balls to circulate smoothly and infinitely.

#### [Highly Corrosion Resistant]

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

#### [Low Noise]

Since the unloaded ball path is made of resin, there is no metal to metal contact and low noise is achieved.

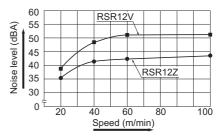

Fig.1 Noise Levels of Models RSR12Z and RSR12V

# **Types and Features**

## **Model RSR-ZM**

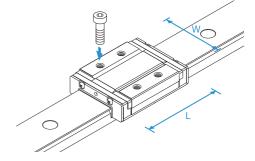

This model is a standard type.

## **Model RSR-WZM**

It has a longer overall LM block length (L), a broader width (W) and greater rated load and permissible moment than RSR-Z.

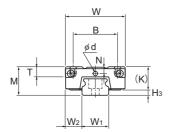

Specification Table⇒▲1-270

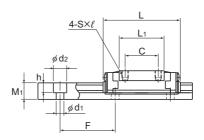

# **Accuracy of the Mounting Surface**

Model RSR-Z uses Gothic arch grooves in the ball raceways. When two rails are used in parallel, any error in accuracy of the mounting surface may increase rolling resistance and negatively affect the smooth motion of the guide. For specific accuracy of the mounting surface, see [Flatness of the Mounting Surface] on **\textstyle{\textstyle{\textstyle{1}}} = 0.1468**.

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) The LM rails of these models are all made of stainless steel.

## **Stopper**

In models RSR-Z/RSR-WZ, the balls fall out if the LM block comes off the LM rail.

For this reason, they are delivered with a stopper fitted to prevent the LM block coming off the rail. If you remove the stopper when using the product, take care to ensure that overrun does not occur.

## Structure and Features

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off.

Because of the angular contact structure where two rows of balls rolling on the LM rail each contact the raceway at 45°, the same load can be applied in all directions (radial, reverse radial and lateral directions) if a set of LM rails and LM block is mounted on the same plane (i.e., when two LM rails are combined with an LM block on the same plane). Furthermore, since the sectional height is low, a compact and stable linear guide mechanism is achieved.

This structure makes clearance adjustment relatively easy, and is highly capable of absorbing a mounting error.

#### [Easy Installation]

Model HR is easier to adjust a clearance and achieve more accuracy than cross-roller guides.

#### [Self-adjustment Capability]

Even if the parallelism or the level between the two rails is poorly established, the self-adjustment capability through front-to-front configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed and smooth straight motion to be achieved even under a preload.

## [4-way Equal Load]

When the two rails are mounted in parallel, each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in various orientations and in applications.

#### [Sectional Dimensions Approximate to Cross-roller Guides]

Since model HR utilizes endcaps for recirculation, cage/retainer creep cannot occur as with cross-roller guides. In addition, the sectional shape of model HR is approximate to that of cross-roller guides, therefore, its components are dimensionally interchangeable with that of cross-roller guides.

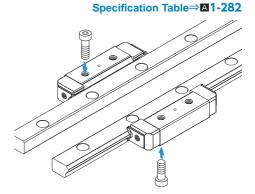

#### [Stainless Steel Type also Available]

A special type whose LM block, LM rail and balls are made of stainless steel is also available.

## **Types and Features**

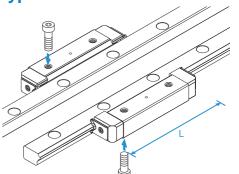

# Model HR - Heavy-load Type

The LM blocks can be mounted from the top and the bottom.

# Model HR-T-Ultra-heavy Load Type

Has the same cross-sectional shape as model HR, but has a greater overall LM block length (L) and a higher load rating.

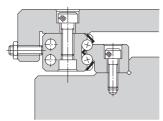

Specification Table⇒A1-282

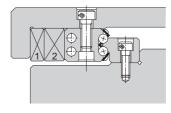

HR

## **Example of Clearance Adjustment**

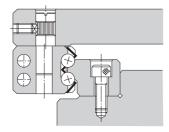

Design the clearance adjustment bolt so that it presses the center of the side face of the LM block.

 Using an adjustment screw
 Normally, an adjustment screw is used to press the LM block.

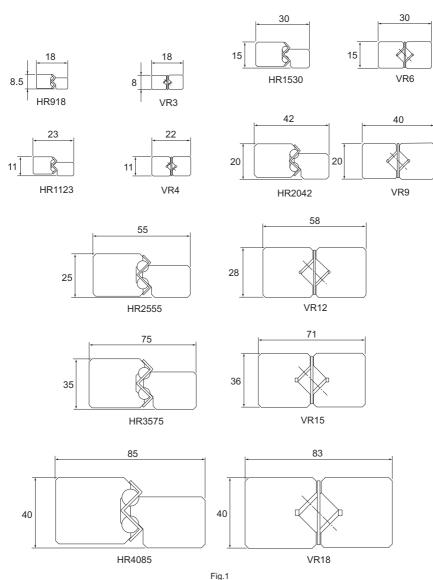

Using tapered gibs
 When high accuracy and high rigidity are required, use tapered gibs 1) and 2).

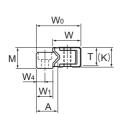

Using an eccentric pin
 A type using an eccentric pin to adjust the clearance is also available.

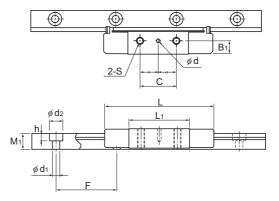

# **Comparison of Model Numbers with Cross-roller Guides**

Each type of LM Guide model HR has sectional dimensions approximate to that of the corresponding cross roller guide model.

Note) Symbol M indicates that stainless steel is used in the LM block, LM rail and balls. Those models marked with this symbol are therefore highly resistant to corrosion and environment.

#### Model number coding

#### +1000L HR2555

Model number Contamination protection accessory No. of LM blocks symbol (\*1)

(in mm) Stainless steel

LM rail length

Symbol for Stainless steel LM rail LM rail jointed use

LM block

Accuracy symbol (\*2) Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP)
Ultra precision grade (UP)

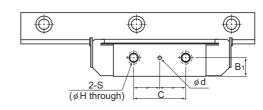

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-81.

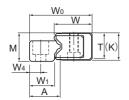

Note) One set of model HR means a combination of two LM rails and an LM blocks used on the same plane.

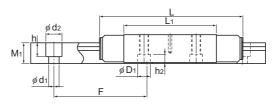

used on the same rail

Note) A moment in the direction Mc can be received if two rails are used in parallel. However, since it depends on the distance be-

tween the two rails, the moment in the direction M<sub>c</sub> is omitted here.

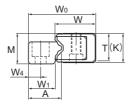

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See 

1-286.)

Static permissible moment\*: 1 block: Static permissible moment value with one LM block mounted on two LM rails used on the same plane

Double blocks: Static permissible moment value with 2 blocks in close contact with each other on 2 LM blocks used on the same plane

Note) A moment in the direction M₀ can be received if two rails are used in parallel. However, since it depends on the distance between the two rails, the moment in the direction M₀ is omitted here.

The maximum length under "Length" indicates the standard maximum length of an LM rail. (See ■1-286.)

Static permissible moment\*: 1 block: Static permissible moment value with one LM block mounted on two LM rails used

on the same plane

Double blocks: Static permissible moment value with 2 blocks in close contact with each other on 2 LM blocks used on the same plane

## Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model HR variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

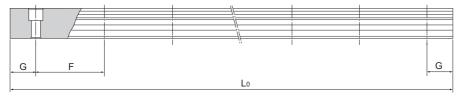

Table1 Standard Length and Maximum Length of the LM Rail for Model HR

Unit: mm

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

## Accessories

## [Dedicated Mounting Bolt]

Normally, when mounting the LM block to adjust a clearance, use the tapped hole provided on the LM block to secure it as shown in Fig.2.

The holes of the bolt ( $d_1$  and  $D_1$ ) must be machined so that they are greater by the adjustment allowance.

If it is inevitable to use the mounting method as indicated by Fig.3 for a structural reason, the dedicated mounting bolt as shown in Fig.4 is required for securing the LM block. Be sure to specify that the dedicated mounting bolt is required when ordering the LM Guide.

## **Greasing Hole**

## [Lubrication for Model HR]

The LM block has a greasing hole in the center of its top face. To provide lubrication through this hole, the table must be machined to also have a greasing hole as shown in Fig.5 and attach a grease nipple or the like. When using oil lubrication, it is necessary to identify the lubrication route. Contact THK for details.

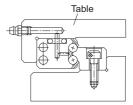

Fig.5 Example of Machining a Greasing Hole

# **Structure and Features**

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off.

As the top face of the LM block is inclined, a clearance is eliminated and an appropriate preload is applied simply by securing the LM block with mounting bolts.

Model GSR has a special contact structure using circular-arc grooves. This increases self-adjusting capability and makes GSR an optimal model for places associated with difficulty establishing high accuracy and for general industrial machinery.

\* Model GSR cannot be used in single-axis applications.

#### [Interchangeability]

Both the LM block and LM rail are interchangeable and can be stored separately. Therefore, it is possible to store a long-size LM rail and cut it to a desired length before using it.

#### [Compact]

Since model GSR has a low center of gravity structure with a low overall height, the machine can be downsized.

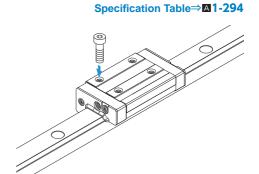

#### [Capable of Receiving a Load in any Direction]

The ball contact angle is designed so that this model can receive a load in any direction. As a result, it can be used in places where a reverse radial load, lateral load or a moment in any direction is applied.

# **Types and Features**

# **Model GSR-T**

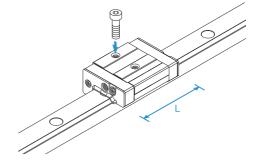

This model is a standard type.

# **Model GSR-V**

A space-saving type that has the same cross-sectional shape as GSR-T, but has a shorter overall LM block length (L).

# **Example of Clearance Adjustment**

By providing a shoulder maybe on the side face of each LM block and pressing either LM block with a bolt, a preload is applied and the rigidity is increased.

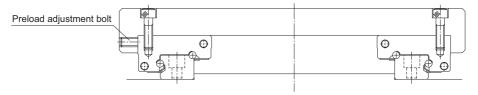

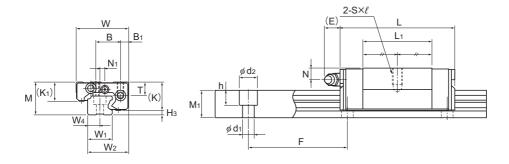

Fig.1 Example of Adjusting a Preload with a Push Bolt

Note) A moment in the direction Mc can be received if two rails are used in parallel. However, since it depends on the distance between the two rails, the moment in the direction Mc is omitted here.

The maximum length under "Length" indicates the standard maximum length of an LM rail. (See M1-296.)

Static permissible moment ": 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Clients who require wall-mounted installations or oil lubrication should contact THK.

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model GSR variations.

In case the required quantity is large and the lengths are not the same, we recommend preparing an LM rail of the maximum length in stock. This is economical since it allows you to cut the rail to the desired length as necessary.

Note) The maximum length varies with accuracy grades. Contact THK for details.

# Tapped-hole LM Rail Type of Model GSR

- Since the bottom of the LM rail has a tapped hole, this model can easily be installed on an H-shape steel and channel.
- Since the top face of the LM rail has no mounting hole, the sealability is increased and entrance of foreign material (e.g., cutting chips) can be prevented.
- (1) Determine the bolt length so that a clearance of 2 to 3 mm is secured between the bolt end and the bottom of the tap (effective tap depth).
- (2) As shown in Fig.2, a tapered washer is also available that allows GSR to be mounted on a section steel.
- (3) For model number coding, see △1-294 to △1-295.

# **Structure and Features**

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off.

As the top face of the LM block is inclined, a clearance is eliminated and an appropriate preload is applied simply by securing the LM block with mounting bolts.

Model GSR-R is based on model GSR, but has rack teeth on the LM rail. This facilitates the design and assembly of drive mechanisms.

\* Model GSR-R cannot be used in single-axis applications.

#### [Reduced Machining and Assembly Costs]

The single-piece structure integrating the LM rail (linear guide) and rack (drive) reduces labor and time for machining the rack mounting surface and assembling and adjusting the guide system, thus to achieve significant cost reduction.

#### [Easy Designing]

The travel distance per turn of the pinion is specified by the integer value. This makes it easy to calculate the travel distance per pulse when the LM Guide is used in combination with a stepping motor or servomotor.

#### [Space Saving]

Since the rail has a rack, the machine size can be reduced.

#### [Long Stroke]

The end faces of the LM rail are machined for jointed use. To obtain a long stroke, simply joint LM rails of the standard length.

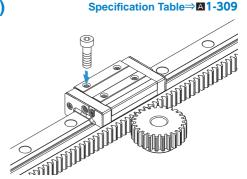

#### [High Durability]

The rack tooth has a width equal to the LM rail height, the rack uses high-grade steel with proven performance and the tooth surface are heat-treated, thereby to ensure high durability.

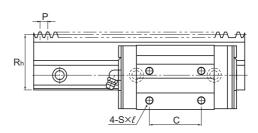

# **Types and Features**

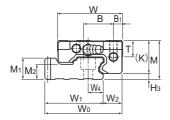

# Model GSR-R (Rail with Rack)

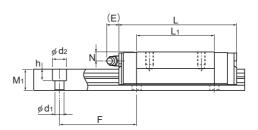

Since the thrust load on the pinion shaft can be kept low due to rack-pinion meshing, it is easy to design systems with pinion shaft bearings and tables that are not so rigid.

# **Model GSR-R**

Model GSR-T-R

## **Rack and Pinion**

#### [Joining Two or More Rails]

The end faces of the rail with rack are machined so that a clearance is left after assembly in order to facilitate the assembly.

Use of a special jig as shown in Fig.1 will make the connection easier.

(THK also offers the rack-aligning jig.)

#### [Reworking the Pinion Hole]

Only the teeth of the reworkable pinion-holediameter type (type C) are heat-treated. The hole and keyway can therefore be reworked by the user to the desired diameter and shape.

When reworking the pinion hole, be sure to take the following into account.

The material of the reworkable hole diameter type (type C): S45C

- (1) When chucking the teeth of a reworkable hole diameter type, use a jaw scroll chuck or something like it to maintain the tooth profile.
- (2) The pinion is produced using the center of the hole as a reference point. The center of the hole should therefore be used as a reference point when the pinion is aligned. When checking the pinion runout, refer to the boss sides.
- (3) Keep the reworked hole diameter within roughly 60 to 70% of the boss diameter.

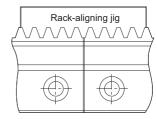

Fig.1 Rack Connection Method

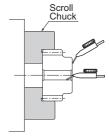

Fig.2

#### [Lubricating the Rack and Pinion]

To ensure smooth sliding on tooth surfaces and prevent wear, the teeth should be provided with a lubricant.

Note1) Use a lubricant of the same type of thickener as that contained in the LM Guide.

Note2) Unpredictable wear may occur in the rack and pinion according to load conditions and lubrication status. Contact THK when undertaking design.

#### [Checking Strength]

The strength of the assembled rack and pinion must be checked in advance.

- (1) Calculate the maximum thrust acting on the pinion.
- (2) Divide the permissible power transmission capacity of the pinion to be used (Table1) by an over-load factor (Table2).
- (3) By comparing the thrust acting on the pinion obtained in step 1 with the pinion power transmission capacity obtained in step 2, make sure the applied thrust does not exceed the permissible power transmission capacity.

#### [Example of calculation]

Model GSR-R is used in a horizontal conveyance system receiving a medium impact (assuming external load to be zero).

#### Conditions

Subject model No. (pinion) GP6-20A

Mass (table + work) m=100kg

Speed v=1 m/s

Acceleration/deceleration time T<sub>1</sub> =0.1 s

#### Consideration

 Calculating the maximum thrust Calculated the thrust during acceleration/ deceleration.

$$Fmax = m \cdot \frac{v}{T_1} = 1.00kN$$

(2) Permissible power transmission capacity of the pinion

Pmax = 
$$\frac{\frac{\text{Permissible power}}{\text{transmission capacity}}}{\frac{\text{(see Table 1)}}{\text{Overload factor}}} = \frac{2.33}{1.25}$$
= 1.86kN

(3) Comparison between the maximum thrust and the permissible power transmission capacity of the pinion

Fmax<Pmax

Therefore, it is judged that the subject model number can be used.

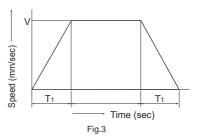

Table1 Permissible Power transmission Capacity

#### Structure and Features

Balls roll in four rows of raceways precision-ground on a LM rail and a LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off even if the LM rail is pulled out.

This model is an integral type of LM Guide that squares an internal structure similar to model HSR, which has a proven track record and is highly reliable, with another and uses two LM rails in combination. It is machined with high precision so that the perpendicularity of the hexahedron of the LM block is within 2  $\mu$ m per 100 mm in error. The two rails are also machined with high precision in relative straightness. As a result, extremely high accuracy in orthogonality is achieved. Since an orthogonal LM system can be achieved with model CSR alone, a conventionally required saddle is no longer necessary, the structure for X-Y motion can be simplified and the whole system can be downsized.

#### [4-way Equal Load]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

#### [High Rigidity]

Since balls are arranged in four rows in a well-balanced manner, this model is stiff against a moment, and smooth straight motion is ensured even a preload is applied to increase the rigidity.

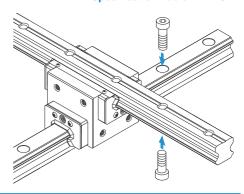

The rigidity of the LM blocks is 50% higher than that of a combination of two HSR LM blocks secured together back-to-back with bolts. Thus, CSR is an optimal LM Guide for building an X-Y table that requires high rigidity.

# **Types and Features**

# **Model CSR-S**

This model is a standard type.

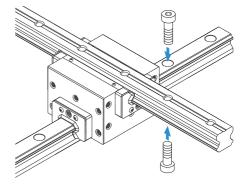

# Specification Table⇒▲1-314

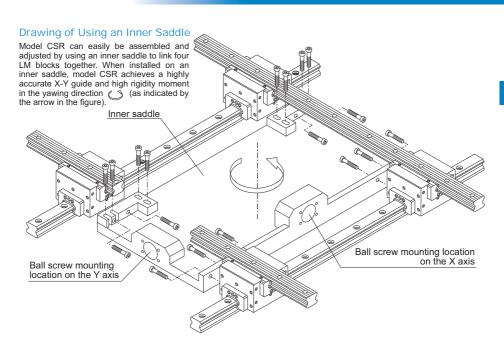

# **Model CSR**

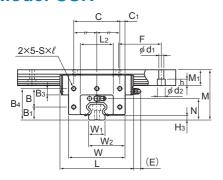

It has a longer overall LM block length (L) and a greater rated load.

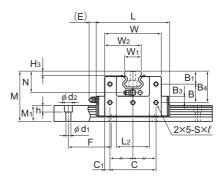

Specification Table⇒A1-314

# **Model CSR**

Note) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-316.) Static permissible moment\*: Static permissible moment value with 1 LM block

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model CSR variations.

For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

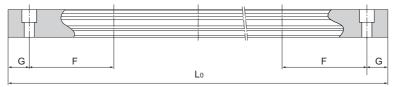

Table1 Standard Length and Maximum Length of the LM Rail for Model CSR

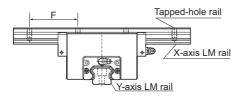

Unit: mm

| Model No.                       | CSR 15                                                                                                                                                  | CSR 20                                                                                                                                                                                   | CSR 25                                                                                                                               | CSR 30                                                                                                                                   | CSR 35                                                                                                                             | CSR 45                                                                                                                                                                                          |

Note) The maximum length varies with accuracy grades. Contact THK for details.

# **Tapped-hole LM Rail Type of Model CSR**

The model CSR variations include a type with its LM rail bottom tapped. With the X-axis LM rail having tapped holes, this model can be secured with bolts from the top.

#### Structure and Features

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. This model is an integral type of LM Guide that squares a unit of miniature LM Guide model RSR with another and uses two LM rails in combination. Since an orthogonal LM system with an extremely low height can be achieved with model MX alone, a conventionally required saddle is no longer necessary and the whole system can be downsized.

#### [4-way Equal Load]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

#### [Tapped-hole LM Rail Type]

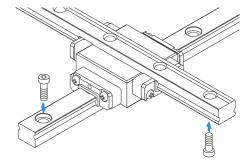

There are two types of the LM rail: one designed to be mounted from the top with bolts, and a semistandard type whose bottom face has tapped holes, allowing the rail to be mounted from the bottom.

# **Types and Features**

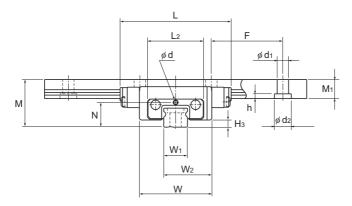

#### Model MX

MX is divided into two types: RSR5 cross type and RSR7W cross type.

#### Specification Table⇒A1-320

Note) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **A1-322**.) Static permissible moment\*: static permissible moment value with 1 LM block

For the LM rail mounting hole, a tapped-hole LM rail type is available as semi-standard.

Model MX5M

Model MX7WM

When mounting the LM rail of model MX7WM, take into account the thread length of the mounting bolt in order not to let the bolt end stick out of the top face of the LM rail.

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model MX variations.

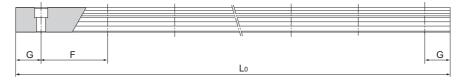

Table1 Standard Length and Maximum Length of the LM Rail for Model MX

#### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate. Since retainer plates hold the balls, they do not fall off even if the LM rail is pulled out.

Model JR uses the same LM block as model HSR, which has a proven track record and is highly reliable. The LM rail has a sectional shape with high flexural rigidity, and therefore can be used as a structural member.

Unlike the conventional LM Guide type, whose LM rail was secured onto the base with bolts when installed, model JR's LM rail is integrated with the mounting base, and the top of the LM rail has the same structure as LM Guide model HSR. The lower part of the LM rail has a hardness of HRC25 or less, making it easy to cut the rail and enabling the rail to be welded.

When welding the rail, we recommend using welding rods compliant with JIS D 5816. (suggested manufacturer and model number: Kobelco LB-52).

#### [4-way Equal Load]

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

#### [Can be Mounted Even Under Rough Conditions]

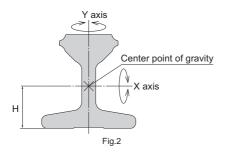

Since the center of the cross-section of the LM rail is slightly thinner, even if the parallelism between two rails is not accurate the LM rail is capable of absorbing the error by bending inward or outward.

#### [Sectional Shape with High Flexural Rigidity]

Since the LM rail has a sectional shape with high flexural rigidity, it can also be used as a structural member. In addition, even when the LM rail is partially fastened or supported in cantilever, the distortion is minimal.

# Second Moment of Inertia of the LM Rail

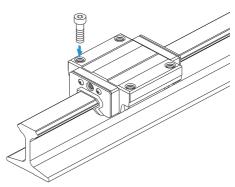

|       | of in           | al moment<br>ertia<br><sup>5</sup> mm <sup>4</sup> ] |                 | lus of<br>tion<br>)4 mm³] | Height of gravi-tational |

# **Types and Features**

# **Model JR-A**

The flange of its LM block has tapped holes.

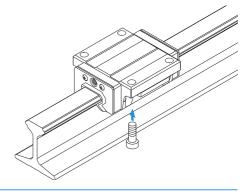

# Specification Table⇒A1-328

# **Model JR-B**

The flange of the LM block has through holes. Used in places where the table cannot have through holes for mounting bolts.

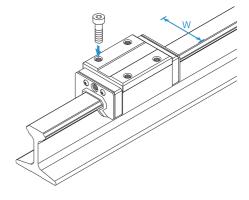

#### Specification Table⇒A1-328

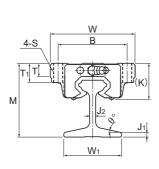

# **Model JR-R**

With this type, the LM block has a smaller width (W) and tapped holes. Used in places where the space for table width is limited.

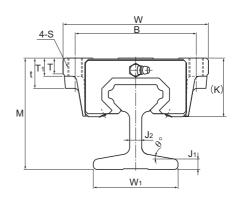

#### Specification Table⇒A1-328

# Models JR-A, JR-B and JR-R

Models JR45 and 55-A

#### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

With a structure that is basically the same as four-way equal load type LM Guide model HSR, which has a proven track record, this R Guide is a new concept product that allows highly accurate circular motion.

#### [Freedom of Design]

Multiple LM blocks can individually move on the same rail. By arranging LM blocks on the load points, efficient structural design is achieved.

#### [Shortened Assembly Time]

This model allows clearance-free, highly accurate circular motion as opposed to sliding guides or cam followers. You can easily assemble this model simply by mounting the LM rail and LM blocks with bolts.

#### [Allows Circular Motion of 5m or Longer]

It allows circular motion of 5 m or longer, which is impossible with swivel bearings.

In addition, use of this model makes it easy to assemble, disassemble and reassemble equipment that circularly moves.

#### [Capable of Receiving Loads in All Directions]

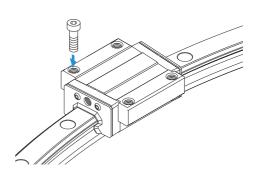

This model is capable of receiving loads in all directions since it has a structure that is basically the same as model HSR.

# **Types and Features**

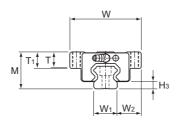

# **Model HCR**

The flange of its LM block has tapped holes.

Specification Table⇒**△1-336**

Note) LM rail radiuses other than the radiuses in the above table are also available. Contact THK for details.

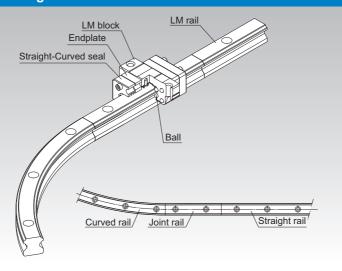

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

The R-Guide center angles in the table are maximum manufacturing angles. To obtain angles greater than them, rails must be additionally connected. Contact THK for details.

# **Structure and Features**

The Straight-Curved Guide HMG is a new straight-curved guide that allows the same type of LM blocks to continuously move on straight and curved rails by combining the technologies of the LM Guide HSR and the R Guide HCR. It achieves drastic cost reduction through improvement of work efficiency at the assembly and conveyance lines and the inspection equipment and simplification of the structure by eliminating a lift and a table.

#### [Freedom of Design]

It allows free combinations of straight and curved shapes.

Since LM blocks can smoothly transit between the straight and curved sections, various combinations of straight and curved rails can be joined into various shapes such as O, U, L and S shapes. In addition, HMG allows a large table to be mounted and a heavy object to be carried through combinations of multiple blocks on a single rail or 2 or more LM rails. Thus, it provides great freedom of design.

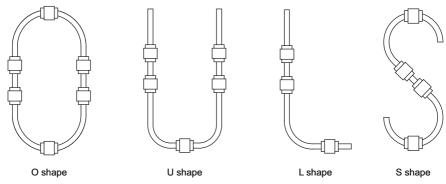

Fig.1 Examples of Joining Rails into Different Shapes

#### [Shortened Transportation Time]

Unlike the shuttle method, using HMG units in a circulating system allows workpieces to be placed while other workpieces are being inspected or mounted, thus to significantly improve process time. Increasing the number of tables can further shorten process time.

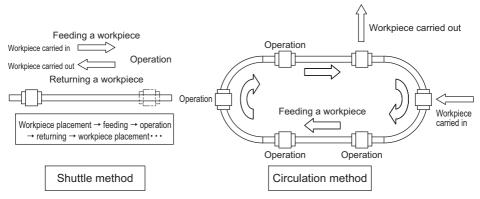

Fig.2 Improved process time

#### [Cost Reduction through a Simplified Mechanism]

Combination of straight and curved rails eliminates a lift and a turntable conventionally used for changing directions in the conveyance and production lines. Therefore, use of HMG simplifies the mechanism and eliminates a large number of parts, allowing the cost to be reduced. Additionally, man-hours in designing can also be reduced.

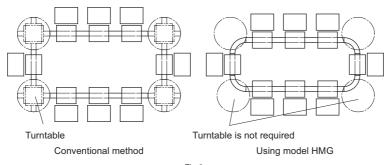

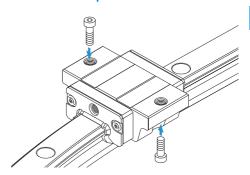

Fig.3

# Types and Features

# **Model HMG**

The flange of the LM block has tapped holes. Can be mounted from the top or the bottom.

#### Specification Table⇒A1-344

# **Examples of Table Mechanisms**

The Straight-Curved Guide HMG requires a rotating mechanism or a slide mechanism for the table to rotate the curved sections when 2 or more rails are used or when 2 or more LM blocks are connected on a single rail. Refer to Fig.4 for examples of such mechanisms.

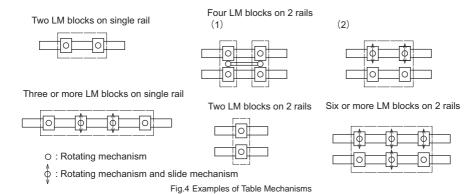

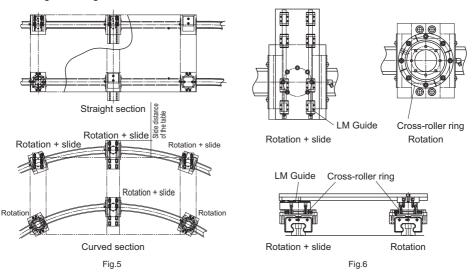

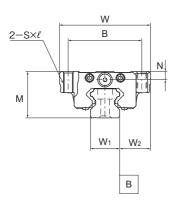

Fig.5 shows examples of designing a table when units are used on multiple axes. HMG requires a rotating mechanism and a slide mechanism since the table is decentered when an LM block transits from a straight section to a curved section. The amount of decentering differs according to the radius of the curved section and the LM block span. Therefore, it is necessary to design the system in accordance with the corresponding specifications.

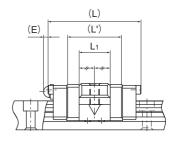

Fig.6 shows detail drawings of the slide and rotating mechanisms. In the figure, LM Guides are used in the slide mechanism and Cross-Roller Rings in the rotating mechanism to achieve smooth sliding and rotating motions.

For driving the Straight-Curved Guide, belt drives and chain drives are available.

When a moment is applied where one LM block is specified per axis, the LM block may experience non-smooth motion. We recommend that multiple LM blocks be used per axis when a moment is applied.

Table 1 shows the static permissible moment of an LM block in the MA, MB and Mc directions.

Table1 Static Permissible Moments of Model HMG

#### Jointed LM rail

#### [Level Difference Specification for the Joint]

An accuracy error in LM rail installation has influence on the service life of the product. When installing the LM rail, take care to minimize the level difference in the joint within the specification indicated in Table2. For the joint between curved rails and another between the curved section and the joint rail, we recommend using a flushing piece like the one shown in Fig.7. When using the flushing piece, place the fixed butt piece on the outer side, push the rail against the butt piece, and then adjust the level difference in the joint section by turning the adjustment screw from the inner side.

Table2 Level Difference Specification for the Joint
Unit: mm

| Model No. | Ball raceway,<br>side face | Upper face | Maximum clearance of the joint section |
|-----------|----------------------------|------------|----------------------------------------|
| 15        | 0.01                       | 0.02       | 0.6                                    |
| 25        | 0.01                       | 0.02       | 0.7                                    |
| 35        | 0.01                       | 0.02       | 1.0                                    |
| 45        | 0.01                       | 0.02       | 1.3                                    |
| 65        | 0.01                       | 0.02       | 1.3                                    |

Note) Place the pin on the outer circumference and the bolt on the inner circumference.

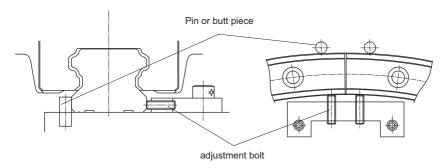

Fig.7 Flush piece

#### [About the Curved Section]

The curved section of model HMG has a clearance for a structural reason. Therefore, this model may not be used in applications where highly accurate feed is required. In addition, the curved section cannot withstand a large moment. When a large moment is applied, it is necessary to increase the number of LM blocks or LM rails. For permissible moment values, see Table 1 on 🔼 1-345.

#### [Jointed LM Rail]

Model HMG always requires a jointed rail where an LM block travels from the straight section to the curved section and where the curve is inverted such as an S curve. Take this into account when design the system.

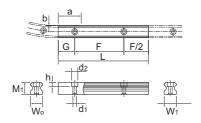

Table3 Dimension of the Jointed Rail

Unit: mm

|           | Dimension of the jointed rail |                           |                           |                                 |       |              |             |        |  |  |  |  |

#### Structure and Features

Model NSR-TBC is the only LM Guide whose casing consists of two pieces instead of a single-piece LM block. The rigid, cast iron casing contains a cylindrical spline nut that is partially cut at an angle of 120°. This enables the model to self-aligning on the fitting surface with the casing, thus to permit rough installation.

#### [Capable of Receiving Loads in All Directions]

NSR-TBC has four rows of balls. The balls are arranged in two rows on each shoulder of the LM rail, and can receive loads in all four directions: upward, downward and lateral directions. Due to the self-aligning structure, however, a rotational moment (Mc) cannot be applied in a single-rail configuration.

#### [Easy Installation and Accuracy Establishment]

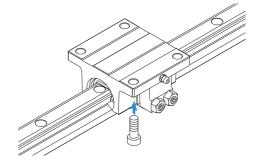

Model NSR-TBC is highly capable of performing self-adjustment and self-alignment. As a result, even if two rails are not mounted with accuracy, the LM casing absorbs the error and it does not affect the traveling performance. Accordingly, the machine performance will not be deteriorated.

# **Types and Features**

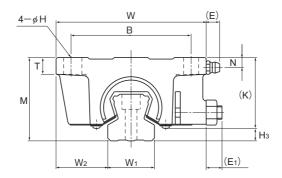

#### **Model NSR-TBC**

The flange of the LM casing has through holes, allowing the LM Guide to be mounted from the bottom.

Note) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **21-352**.) Static permissible moment\*: Double casings: static permissible moment value with 2 casings closely contacting with each other

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model NSR-TBC variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details.

For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

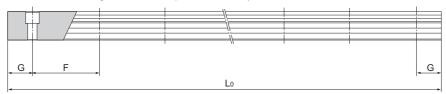

Table1 Standard Length and Maximum Length of the LM Rail for Model NSR-TBC

#### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Each row of balls is placed at a contact angle of  $45^{\circ}$  so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

The high temperature type LM Guide is capable of being used at service temperature up to 150°C thanks to THK's unique technologies in material, heat treatment and lubrication.

#### [Maximum Service Temperature: 150°C]

Use of stainless steel in the endplates and high temperature rubber in the end seals achieves the maximum service temperature of 150°C.

#### [Dimensional Stability]

Since it is dimensionally stabilized, it demonstrates superb dimensional stability after being heated or cooled (note that it shows linear expansion at high temperature).

#### [Highly Corrosion Resistant]

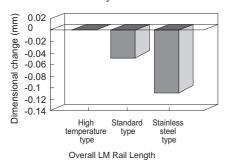

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

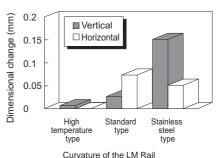

#### [High Temperature Grease]

This model uses high temperature grease that shows little grease-based fluctuation in rolling resistance even if temperature changes from low to high levels.

#### Dimensional Stability Data

Since this model has been treated for dimensional stability, its dimensional change after being cooled or heated is only minimal.

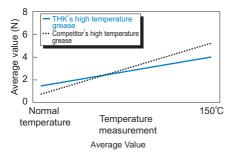

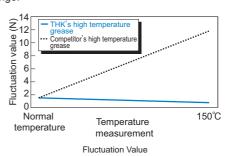

Note1) The above data on overall length and curvature indicate dimensional change when the LM rail is cooled to normal temperature after being heated at 150°C for 100 hours.

Note2) The samples consist of high temperature, standard and stainless steel types of model HSR25 + 580L.

#### Rolling Resistance Data in Relation to Grease

Use a high temperature grease with which the rolling resistance of the LM system little fluctuates even temperature changes from a normal to high range.

For the measurements above, model HSR25M1R1C1 is used.

#### Thermal Characteristics of LM Rail and LM Block Materials

Specific heat capacity: 0.481 J/(g•K) Thermal conductivity: 20.67 W/(m•K)

Average coefficient of linear expansion: 11.8×10<sup>-6</sup>/°C

# **Types and Features**

# **Model HSR-M1A**

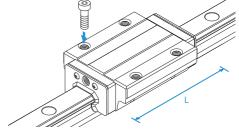

The flange of its LM block has tapped holes.

# **Model HSR-M1LA**

The LM block has the same cross-sectional shape as model HSR-M1A, but has a longer overall LM block length (L) and a greater rated load.

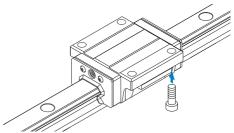

Specification Table⇒▲1-360

# **Model HSR-M1B**

The flange of the LM block has through holes. Used in places where the table cannot have through holes for mounting bolts.

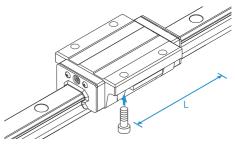

Specification Table⇒A1-362

# **Model HSR-M1LB**

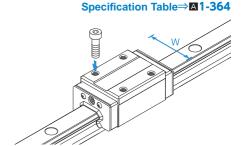

The LM block has the same sectional shape as model HSR-M1B, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒A1-362

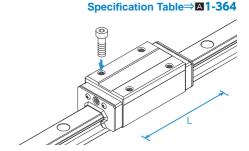

# **Model HSR-M1R**

With this type, the LM block has a smaller width (W) and tapped holes. Used in places where the space for table width is limited.

# Model HSR-M1LR

The LM block has the same sectional shape as model HSR-M1R, but has a longer overall LM block length (L) and a greater rated load.

Specification Table⇒ 1-366

### Model HSR-M1YR

When using two units of LM Guide facing each other, the previous model required much time in machining the table and had difficulty achieving the desired accuracy and adjusting the clearance. Since model HSR-M1YR has tapped holes on the side of the LM block, a simpler structure is gained and significant man-hour cutting and accuracy increase can be achieved.

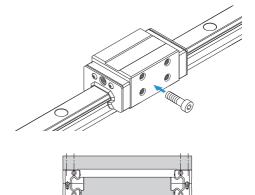

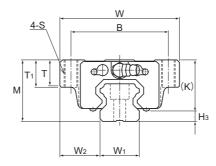

Fig.1 Conventional Structure

Fig.2 Mounting Structure for Model HSR-M1YR

# **Service Life**

When using this product in temperatures higher than 100°C, always multiply the basic dynamic load rating by the temperature coefficient when calculating the rated service life. See **A1-64** for details.

Note) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **21-368**.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block Double blocks: static permissible moment value with 2 blocks closely contacting with each other

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model HSR-M1 variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details.

For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

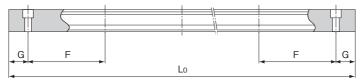

Table1 Standard Length and Maximum Length of the LM Rail for Model HSR-M1

Unit: mm

| Model No.        | HSR 15M1 | HSR 20M1 | HSR 25M1 | HSR 30M1 | HSR 35M1 |

#### Structure and Features

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Since it is a compactly designed model that has a low sectional height and a ball contact structure rigid in the radial direction, this model is optimal for horizontal guide units.

High temperature type LM Guide model SR-M1 is capable of being used at service temperature up to 150°C thanks to THK's unique technologies in material, heat treatment and lubrication.

#### [Maximum Service Temperature: 150°C]

Use of stainless steel in the endplates and high temperature rubber in the end seals achieves the maximum service temperature of 150°C.

#### [Dimensional Stability]

Since it is dimensionally stabilized, it demonstrates superb dimensional stability after being heated or cooled (note that it shows linear expansion at high temperature).

#### [Highly Corrosion Resistant]

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

#### [High Temperature Grease]

This model uses high temperature grease that shows little grease-based fluctuation in rolling resistance even if temperature changes from low to high levels.

### Thermal Characteristics of LM Rail and LM Block Materials

- Specific heat capacity: 0.481 J/(g•K)
  Thermal conductivity: 20.67 W/(m•K)
- Average coefficient of linear expansion: 11.8 × 10<sup>-6</sup>/°C

# **Types and Features**

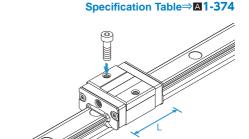

## **Model SR-M1W**

With this type, the LM block has a smaller width (W) and tapped holes.

Specification Table⇒A1-374

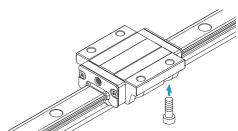

# **Model SR-M1V**

A space-saving type whose LM block has the same cross-sectional shape as model SR-M1W, but has a smaller overall LM block length (L).

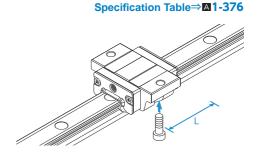

# **Model SR-M1TB**

The LM block has the same height as model SR-M1W and can be mounted from the bottom.

# Model SR- M1SB

A space-saving type whose LM block has the same sectional shape as model SR-M1TB, but has a smaller overall LM block length (L).

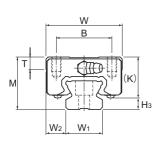

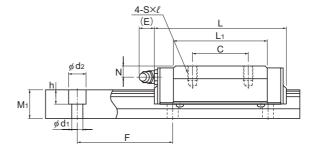

Specification Table⇒A1-376

# **Service Life**

When using this product in temperatures higher than 100°C, always multiply the basic dynamic load rating by the temperature coefficient when calculating the rated service life. See **A1-64** for details.

Note1) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-378.) Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Note2) For models SR15 and 25, two types of rails with different mounting hole dimensions are offered (see Table1). When, replacing this model with model SSR, pay attention to the mounting hole dimension of the LM rail. Contact THK for details.

Table1 The dimension of the rail mounting hole

| Model No. | Standard rail      | Semi-Standard rail |
|-----------|--------------------|--------------------|
| SR 15     | For M3 (No symbol) | For M4 (Symbol Y)  |
| SR 25     | For M6 (Symbol Y)  | For M5 (No symbol) |

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model SR-M1 variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details.

For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

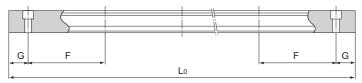

Table1 Standard Length and Maximum Length of the LM Rail for Model SR-M1

#### Structure and Features

Balls roll in two rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

High temperature type miniature LM Guide model RSR-M1 is capable of being used at service temperature up to 150°C thanks to THK's unique technologies in material, heat treatment and lubrication.

#### [Maximum Service Temperature: 150°C]

Use of stainless steel in the endplates and high temperature rubber in the end seals achieves the maximum service temperature of 150°C.

#### [Dimensional Stability]

Since it is dimensionally stabilized, it demonstrates superb dimensional stability after being heated or cooled (note that it shows linear expansion at high temperature).

#### [Highly Corrosion Resistant]

Since the LM block, LM rail and balls use stainless steel, which is highly corrosion resistant, this model is optimal for clean room applications.

#### [High Temperature Grease]

This model uses high temperature grease that shows little grease-based fluctuation in rolling resistance even if temperature changes from low to high levels.

## Thermal Characteristics of LM Rail and LM Block Materials

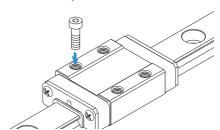

- Specific heat capacity: 0.481 J/(g•K)
- Thermal conductivity: 20.67 W/(m•K)
- Average coefficient of linear expansion: 11.8 × 10<sup>-6</sup>/°C

# **Types and Features**

# Models RSR-M1, RSR-M1K, M1V

This model is a standard type.

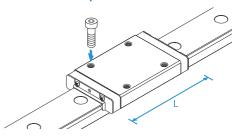

#### Specification Table⇒A1-384

# Model RSR-M1N

It has a longer overall LM block length (L) and a greater rated load than standard types.

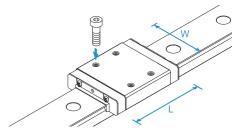

#### Specification Table⇒A1-384

# Models RSR-M1W, M1WV

These models have greater overall LM block lengths (L), broader widths (W) and greater rated loads and permissible moments than standard types.

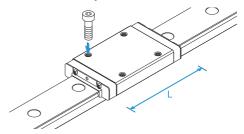

Specification Table⇒A1-386

# **Model RSR-M1WN**

It has a longer overall LM block length (L), a greater rated load than standard types. Achieves the greatest load capacity among the high temperature type miniature LM Guide models.

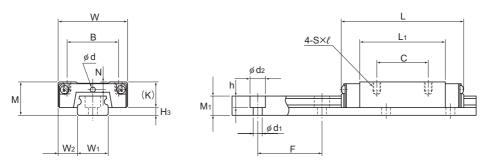

Specification Table⇒A1-386

# **Service Life**

When using this product in temperatures higher than 100°C, always multiply the basic dynamic load rating by the temperature coefficient when calculating the rated service life. See **A1-64** for details.

Note) The maximum length varies with accuracy grades. Contact THK for details.

# Stopper

In models RSR-M1/RSR-M1W, the balls fall out if the LM block comes off the LM rail.

For this reason, they are delivered with a stopper fitted to prevent the LM block coming off the rail. If you remove the stopper when using the product, take care to ensure that overrun does not occur.

Table2 Model RSR-M1/RSR-M1W stopper (C type) specification table

Unit: mm

# **Structure and Features**

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and endplates incorporated in the LM block allow the balls to circulate.

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse radial and lateral directions), enabling the LM Guide to be used in all orientations.

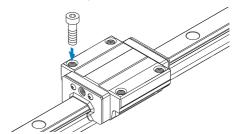

The LM rail, LM block and balls are made of highly corrosion resistant stainless steel and the other metal parts are made of stainless steel, allowing superb corrosion resistance to be achieved. As a result, the need for surface treatment is eliminated.

# **Types and Features**

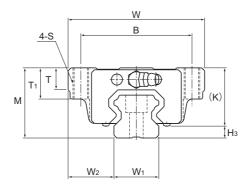

## Model HSR-M2A

The flange of its LM block has tapped holes.

#### Specification Table⇒A1-392

Note) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-394.)

The basic load rating of the high corrosion resistance type LM Guide is smaller than ordinary stainless steel LM Guides. Static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

# Standard Length and Maximum Length of the LM Rail

Table1 shows the standard lengths and the maximum lengths of model HSR-M2 variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details.

For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

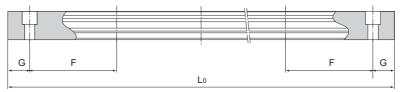

Table1 Standard Length and Maximum Length of the LM Rail for Model HSR-M2

## **Structure and Features**

### [Features]

- Operable in various environments at pressure between atmospheric pressure and vacuum (10<sup>3</sup> [Pa]).
- Capable of withstanding baking temperature up to 200℃\*
- Use of a newly developed labyrinth end seal dedicated for Medium-to-Low Vacuum increases grease retention and allows extended use in vacuum.
- Use of grease designed for Medium-to-Low Vacuum achieves a stable rolling resistance.
- \* If the baking temperature exceeds 100°C, multiply the basic load rating with the temperature coefficient.

# Structure of the labyrinth end seal dedicated for Medium-to-Low Vacuum

The labyrinth end seal dedicated for Medium-to-Low Vacuum forms a multi-stage space as shown in the figure on the right to minimize the pressure difference between adjacent stages. This reduces the outflow velocity of the oil inside the LM block to a minimum. In addition, the seal will not affect the rolling resistance since it does not contact the LM rail.

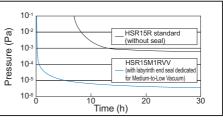

### [Achievable vacuum level]

The LM Guide for Medium-to-Low Vacuum demonstrates an excellent achievable vacuum level.

[Test conditions] Temperature: 25°C (±5°C)

| [        | [                                                             |                        |  |  |  |  |  |  |  |

Achievable vacuum level

### [Rolling resistance]

The grease used in the LM Guide for Mediumto-Low Vacuum has a smaller rolling resistance than conventional fluorine grease and ensures stable rolling motion.

Specimen: HSR15M1RVV Temperature: 25°C (±5°C) Pressure: atmospheric pressure

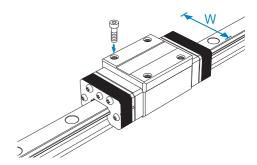

Rolling resistance fluctuation

# **Types and Features**

## **Model HSR-M1RVV**

With this type, the LM block has a smaller width (W) and tapped holes. Used in places where the space for table width is limited.

## Specification Table⇒▲1-400

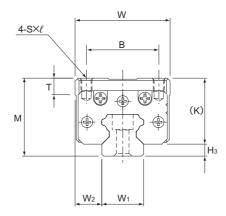

## **Precautions on Design**

If a large moment is applied to a system consisting of one block on one axis, the labyrinth end seal may contact the rail, and it may affect the motion.

If a moment is applied, we recommend using two axes with two blocks per axis. Contact THK for details.

## **Structure and Features**

## [Structural Characteristics]

- Uses stainless steel
   All components are composed of parts for special environments such as stainless steel.
- Degreased and cleaned Special solvent is used to de-grease this model.
- Does not use grease
   Use of highly reliable dry lubricant S-compound film for stainless steel balls achieves grease-free lubrication.

Greatest advantage

Suitable for applications where the vacuum level reaches 10<sup>st</sup>. Pa and chemical contamination (gaseous contamination such as organic matter and moisture) is not allowed.

\* Can be used at temperature up to 150°C (instantaneously 200°C).

## [What is Dry Lubrication S-Compound Film]

Dry Lubrication S-Compound Film is a fully dry lubricant developed for use under atmospheric to high-vacuum environments.

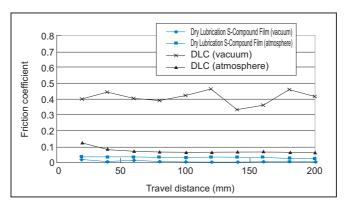

It has superior characteristics in load carrying capacity, wear resistance and sealability to other lubrication systems.

| Companson of dry lubrication material properties |                                        |                      |          |                          |  |  |  |  |  |

Comparison of dry lubrication material properties

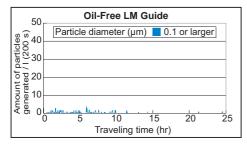

### [Low Friction]

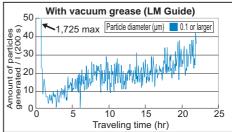

The Oil-Free LM Guide for special environments exerts superbly low frictional properties in atmospheric to vacuum environments.

## [Low Dust Generation]

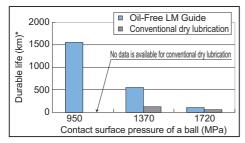

The Oil-Free LM Guide for special environments exerts a lower level of dust generation than conventional vacuum grease lubricants.

### [Long service life]

The Oil-Free LM Guide for special environments has a longer service life than conventional dry lubrication.

\* The durable life represents the value at a point from which the Dry Lubrication S-Compound Film is no longer effective.Note that the durable life differs from the rated service life of the LM Guide.

## **Precautions on Use**

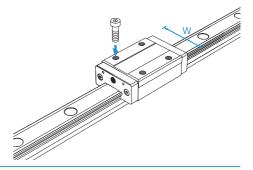

- The oil-free LM Guide is characterized by its performance in environments at high temperature
  and atmospheric pressure to high vacuum, and does not assume use in places requiring rigidity.
  Therefore, preloading it would affect the strength of the S film, and it does not support preloaded
  products.
- Temperature range is −20 to 150°C.
- To prevent the performance of the dry lubricant from being degraded, use the product in an environment with no condensation at humidity 40% or less.
- · Does not support joint use.
- Since the mounting precision of the Oil-Free LM Guide is smaller than ordinary LM Guides, take much care when installing it.

## **Types and Features**

## **Model SR-MSW**

With this type, the LM block has a smaller width (W) and tapped holes.

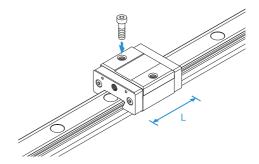

## Specification Table⇒▲1-408

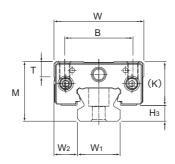

## **Model SR-MSV**

A space-saving type whose LM block has the same cross-sectional shape as model SR-MSW, but has a smaller overall LM block length (L).

## Specification Table⇒A1-408

Note1) The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See **M1-410**.) For the durability of the Oil-Free LM Guide for special environment, contact THK.

The value of permissible load F0 represents the permissible value for the strength of the dry lubricant S-compound film. Since the service life of the S film may vary according to the environment or the operating conditions, be sure to evaluate and validate the life under the service conditions and operating conditions at the customer.

Note2) For model SR15, two types of rails with different mounting hole dimensions are offered (see Table1).

When, replacing this model with model SSR, pay attention to the mounting hole dimension of the LM rail.

Contact THK for details.

Table1 The dimension of the rail mounting hole

| Model No. | Standard rail      | Semi-Standard rail |  |  |
|-----------|--------------------|--------------------|--|--|
| SR 15     | For M3 (No symbol) | For M4 (Symbol Y)  |  |  |

# Standard Length and Maximum Length of the LM Rail

The following table shows the standard length and the maximum length of the LM rail of the Oil-Free LM Guide for special environments. If the overall rail length exceeds the maximum length, contact THK.

For dimension G if you require a special length, we recommend using the dimensions in the table. If dimension G is longer, the respective part tends to become unstable after installation, which may negatively affect the accuracy.

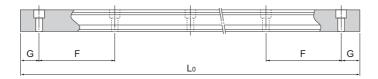

Table1 Standard Length and Maximum Length of the LM Rail for Model SR-MS

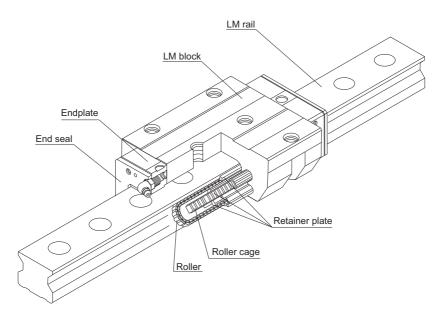

Unit: mm

Note1) If you desire a rail length larger than the maximum length, contact THK.

Note2) A connected-rail type is not available.

# Structure and Features of the Caged Roller LM Guide

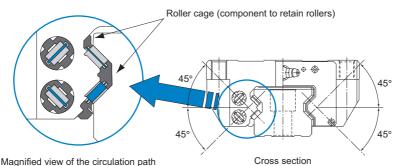

Fig.1 Structural Drawing of the Caged Roller LM Guide Model SRG

Caged Roller LM Guide is a roller guide that achieves low-friction, smooth motion and long-term maintenance-free operation by using a roller cage. In addition, to ensure ultra-high rigidity, rollers with low elastic deformation are used as the rolling elements and the roller diameter and the roller length are optimized.

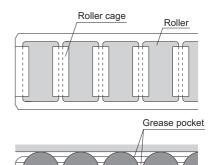

Furthermore, the lines of rollers are placed at a contact angle of 45° so that the same rated load is applied in all (radial, reverse and lateral) directions.

## Features and Dimensions of Each Model

Structure and Features of the Caged Roller LM Guide

## **Advantages of the Caged Roller Technology**

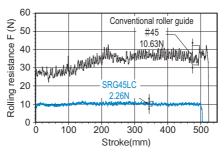

- (1) Evenly spaced and aligned rollers circulate, preventing the rollers from skewing, minimizing rolling resistance fluctuations and achieving smooth and stable motion.
- (2) The absence of friction between rollers allows grease to be retained in grease pockets and achieves long-term maintenance-free operation.
- (3) The absence of friction between rollers achieves low heat generation and superbly high speed.
- (4) The absence of roller-to-roller collision ensures low noise and acceptable running sound.

## [Smooth Motion]

## Rolling Resistance Data

Evenly spaced and aligned rollers circulate, minimizing rolling resistance fluctuations and achieving smooth and stable motion.

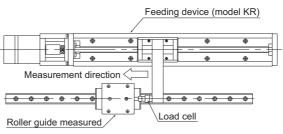

Result of Measuring Rolling Resistance Fluctuations

[Conditions]

## Structure and Features

SRN is an ultra-high rigidity Roller Guide that uses roller cages to allow low-friction, smooth motion and achieve long-term maintenance-free operation.

### [Ultra-high Rigidity]

A higher rigidity is achieved by using highly rigid rollers as the rolling elements and having the overall roller length more than 1.5 times greater than the roller diameter.

### [4-way Equal Load]

Since each row of rollers is arranged at a contact angle of 45°so that the LM block receives an equal load rating in all four directions (radial, reverse radial and lateral directions), high rigidity is ensured in all directions.

### [Smooth Motion through Skewing Prevention]

The roller cage allows rollers to form an evenly spaced line while circulating, thus preventing the rollers from skewing as the block enters an loaded area. As a result, fluctuation of the rolling resistance is minimized, and stable, smooth motion is achieved.

### [Long-term Maintenance-free Operation]

Use of roller cages eliminates friction between rollers and increases grease retention, enabling long-term maintenance-free operation to be achieved.

### [Global Standard Size]

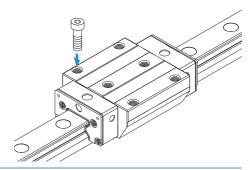

SRG is designed to have dimensions almost the same as that of Full Ball LM Guide model HSR, which THK as a pioneer of the linear motion system has developed and is practically a global standard size.

## **Types and Features**

## Models SRG-15A, 20A

The flange of the LM block has tapped holes. Can be mounted from the top or the bottom.

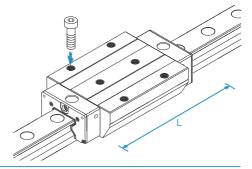

## Specification Table⇒A1-422

## **Model SRG-20LA**

The LM block has the same cross-sectional shape as model SRG-A, but has a longer overall LM block length (L) and a greater rated load.

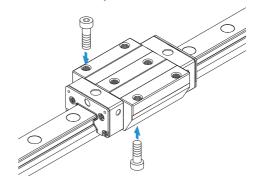

## Specification Table⇒A1-422

## **Model SRG-C**

The flange of the LM block has tapped holes. Can be mounted from the top or the bottom. Used in places where the table cannot have through holes for mounting bolts.

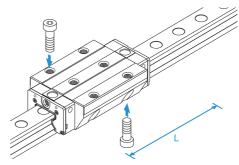

## Specification Table⇒A1-422

## **Model SRG-LC**

The LM block has the same cross-sectional shape as model SRG-C, but has a longer overall LM block length (L) and a greater rated load.

## Specification Table⇒A1-422

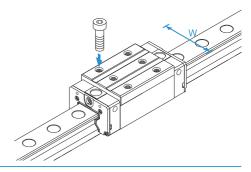

## **Model SRG-R**

With this type, the LM block has a smaller width (W) and tapped holes.

Used in places where the space for table width is limited.

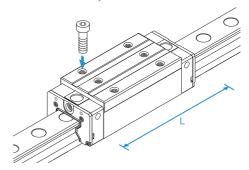

## Specification Table⇒A1-426

## **Model SRG-LR**

The LM block has the same cross-sectional shape as model SRG-R, but has a longer overall LM block length (L) and a greater rated load.

## Specification Table⇒A1-426

# **Error Allowance of the Mounting Surface**

The caged roller LM Guide Model SRG features high rigidity since it uses rollers as its rolling element and it also features a cage-retainer which prevents the rollers from skewing. However, high machining accuracy is required in the mounting surface. If the error on the mounting surface is large, it will affect the rolling resistance and the service life. The following shows the maximum permissible value according to the radial clearance.

Table1 Error Allowance in Parallelism (P) between Two Rails

Unit: mm

| Radial clearance | Normal | C1    | C0    |
|------------------|--------|-------|-------|

Note1) The greasing hole on the top face and the pilot hole of the side nipple are not drilled through in order to prevent foreign material from entering the block.

THK will mount a grease nipple per your request. Therefore, do not use the greasing hole of the top face and the side nipple pilot hole\* for purposes other than mounting a grease nipple. In case of oil lubrication, be sure to let THK know the mounting orientation and the exact position in each LM block

where the piping joint should be attached.

For the mounting orientation and the lubrication, see **\( \bigcirc{\text{\text{M}}1-12}\)** and **\( \bigcirc{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\texitext{\text{\text{\text{\text{\text{\t** 

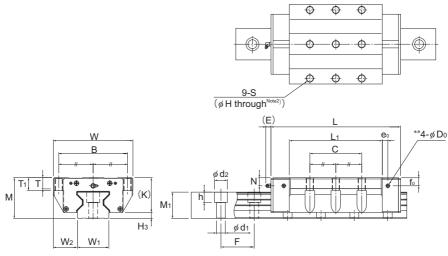

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

Note2) If the mounting holes (4 holes) of the LM block are back spot-faced, these models can be mounted on the table from the top and the bottom as with model SRG-C.

The value in the parentheses represents a dimension if the mounting hole is back spot-faced.

Contact THK for details.

Note1) The greasing hole on the top face and the pilot hole of the side nipple" are not drilled through in order to prevent for-eign material from entering the block.

See A1-429 for details.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-428.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with

each other

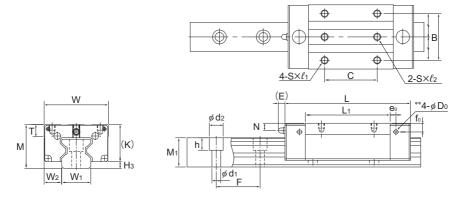

The removing/mounting jig is not provided as standard. When desiring to use it, contact THK.

Note2) The LM block mounting holes (9 holes) of SRG85LC are all through holes (full thread).

Note3) The LM block mounting holes in part (a) (6 holes) of SRG100LC are through holes (full thread).

The LM block mounting holes in part (b) (3 holes) have effective thread depth of 22 mm.

### Model number coding

# SRG45 LR 2 QZ KKHH C0 +1200L P T - II

Model Type of number LM block

With QZ Lubricator Contamination protection accessory symbol (\*1)

LM rail length (in mm) Symbol for No. of rails used on the same plane (\*4)
Symbol for LM

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Acc

rail jointed use

Light preload (C1)
Medium preload (C0)
Medium preload (C0)
Ultra precision grade (UP)
Ultra precision grade (UP)

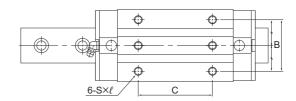

(\*1) See contamination protection accessory on ▲1-510. (\*2) See ▲1-72. (\*3) See ▲1-77. (\*4) See ▲1-13.

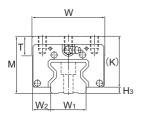

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

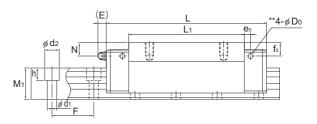

Those models equipped with QZ Lubricator cannot have a grease nipple.

Note) The greasing hole on the top face and the pilot hole of the side nipple' are not drilled through in order to prevent foreign material from entering the block.

THK will mount a grease nipple per your request. Therefore, do not use the greasing hole of the top face and the side nipple pilot hole\* for purposes other than mounting a grease nipple.

In case of oil lubrication, be sure to let THK know the mounting orientation and the exact position in each LM block where the piping joint should be attached.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-428.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

## Standard Length and Maximum Length of the LM Rail

Table4 shows the standard lengths and the maximum lengths of model SRG variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

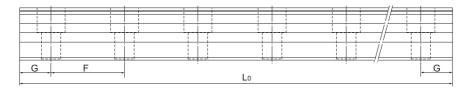

Table4 Standard Length and Maximum Length of the LM Rail for Model SRG

Unit: mm

| Model No.                          | SRG 15                                                                                                                                   | SRG 20                                                                                                                                                                                   | SRG 25                                                                                                                                                                                                   | SRG 30                                                                                                                                                                                                      | SRG 35                                                                                                                                                                                              | SRG 45                                                                                                                                                                                          | SRG 55                                                                                                                                                     | SRG 65                       | SRG 85                       | SRG 100                      |

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

## **Greasing Hole**

## [Greasing Hole for Model SRG]

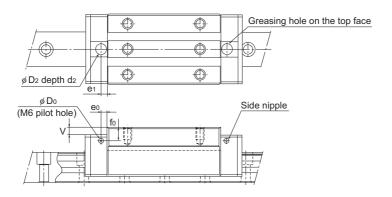

Model SRG allows lubrication from both the side and top faces of the LM block. The greasing hole of standard types is not drilled through in order to prevent foreign material from entering the LM block. When using the greasing hole, contact THK.

When using the greasing hole on the top face of models SRG-R and SRG-LR, a greasing adapter is separately required. Contact THK for details.

If the mounting orientation of the LM Guide is other than horizontal use, the lubricant may not reach the raceway completely.

Be sure to let THK know the mounting orientation and the exact position in each LM block where the grease nipple or the piping joint should be attached.

For the mounting orientation and the lubrication, see A1-12 and A24-2, respectively.

Note) The greasing interval is longer than that of full-roller types because of the roller cage effect. However, the actual greasing interval may vary depending on the service environment, such as a high load and high speed. Contact THK for details.

#### Structure and Features

SRN is an ultra-high rigidity Roller Guide that uses roller cages to allow low-friction, smooth motion and achieve long-term maintenance-free operation.

#### [Ultra-high Rigidity]

A higher rigidity is achieved by using highly rigid rollers as the rolling elements and having the overall roller length more than 1.5 times greater than the roller diameter.

#### [4-way Equal Load]

Since each row of rollers is arranged at a contact angle of 45°so that the LM block receives an equal load rating in all directions (radial, reverse radial and lateral directions), high rigidity is ensured in all directions.

#### [Smooth Motion through Skewing Prevention]

The roller cage allows rollers to form an evenly spaced line while circulating, thus preventing the rollers from skewing as the block enters an loaded area. As a result, fluctuation of the rolling resistance is minimized, and stable, smooth motion is achieved.

#### [Long-term Maintenance-free Operation]

Use of roller cages eliminates friction between rollers and increases grease retention, enabling long-term maintenance-free operation to be achieved.

#### [Low-Profile Low Center of Gravity]

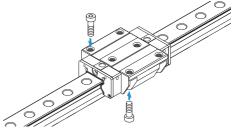

Because it has a lower total height than the Caged Roller LM Guide Model SRG, it is ideal for compact designs.

### **Types and Features**

### **Model SRN-C**

The flange of the LM block has tapped holes. Can be mounted from the top or the bottom. Used in places where the table cannot have through holes for mounting bolts.

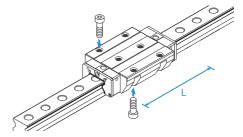

# Specification Table⇒ ▲1-436

### **Model SRN-LC**

The LM block has the same cross-sectional shape as model SRN-C, but has a longer overall LM block length (L) and a greater rated load.

#### Specification Table⇒A1-436

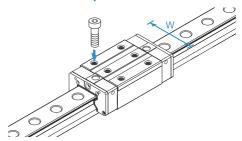

### **Model SRN-R**

With this type, the LM block has a smaller width (W) and tapped holes.

Used in places where the space for table width is limited.

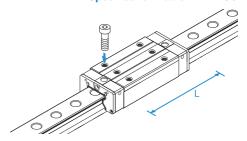

#### Specification Table⇒A1-438

### **Model SRN-LR**

The LM block has the same cross-sectional shape as model SRN-R, but has a longer overall LM block length (L) and a greater rated load.

#### Specification Table⇒▲1-438

### **Error Allowance of the Mounting Surface**

The caged roller LM Guide Model SRG features high rigidity since it uses rollers as its rolling element and it also features a cage which prevents the rollers from skewing. However, high machining accuracy is required in the mounting surface. If the error on the mounting surface is large, it will affect the rolling resistance and the service life. The following shows the maximum permissible value according to the radial clearance.

Table1 Error Allowance in Parallelism (P) between Two Rails

Unit: mm

| Radial clearance | Normal | C1    | C0       |  |  |
|------------------|--------|-------|----------|--|--|
| Model No.        | Normai |       | <u> </u> |  |  |
| SRN 35           | 0.014  | 0.010 | 0.007    |  |  |
| SRN 45           | 0.017  | 0.013 | 0.009    |  |  |
| SRN 55           | 0.021  | 0.014 | 0.011    |  |  |
| SRN 65           | 0.027  | 0.018 | 0.014    |  |  |

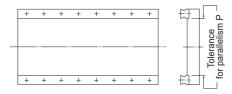

Fig.1

Table2 Error Allowance in Vertical Level (X) between Two Rails

Unit: mm

| Radial clearance                            | Normal     | C1       | C0       |
|---------------------------------------------|------------|----------|----------|
| Permissible error on the mounting surface X | e 0.00030a | 0.00021a | 0.00011a |

 $X=X_1+X_2$   $X_1$ : Level difference on the rail mounting surface

X2 : Level difference on the block mounting surface

X<sub>1</sub>

#### Model number coding

SRN45 C 2 KK C0 +1160L P T - II

Model Type of number LM block

Contamination protection accessory symbol (\*1)

LM rail length (in mm)

Symbol for No. of rails used on the same plane (\*4)
Symbol for LM rail jointed use

No. of LM blocks used on the same rail

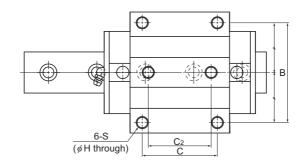

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

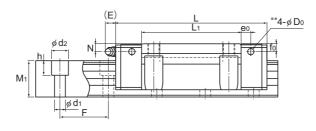

Accuracy symbol (\*3)
Precision grade (P)/Super precision grade (SP)
Ultra precision grade (UP)

(\*1) See contamination protection accessory on **A1-510**. (\*2) See **A1-72**. (\*3) See **A1-77**. (\*4) See **A1-13**.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Unit: mm

Note) The greasing hole on the top face and the pilot hole of the side nipple\*\* are not drilled through in order to prevent foreign material from entering the block.

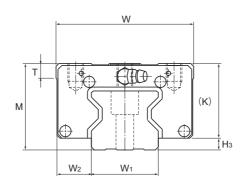

See **\times1-441** for details.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-440.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

#### Model number coding

SRN45 LR 2 KK C0 +1200L P T - II

Model Type of number LM block Contamination protection accessory symbol (\*1)

LM rail length (in mm)

Symbol for No. of rails used on the same plane (\*4)
Symbol for LM rail jointed use

No. of LM blocks used on the same rail

Radial clearance symbol (\*2) Normal (No symbol) Light preload (C1) Medium preload (C0)

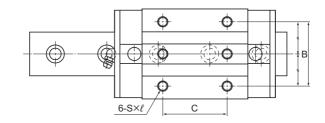

Accuracy symbol (\*3) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

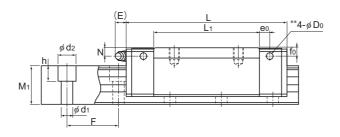

(\*1) See contamination protection accessory on **Δ1-510**. (\*2) See **Δ1-72**. (\*3) See **Δ1-77**. (\*4) See **Δ1-13**.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Unit: mm

Note) The greasing hole on the top face and the pilot hole of the side nipple\*\* are not drilled through in order to prevent foreign material from entering the block.

See **\textstyle 1-441** for details.

See 11-44 for details.

The maximum length under "Length" indicates the standard maximum length of an LM rail. (See 11-440.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

### Standard Length and Maximum Length of the LM Rail

Table4 shows the standard lengths and the maximum lengths of model SRN variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used. Contact THK for details. For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

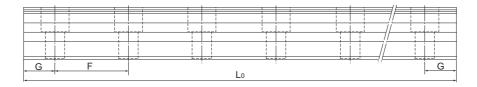

Table4 Standard Length and Maximum Length of the LM Rail for Model SRN

Unit: mm

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

### **Greasing Hole**

#### [Greasing Hole for Model SRN]

Model SRN allows lubrication from both the side and top faces of the LM block. The greasing hole of standard types is not drilled through in order to prevent foreign material from entering the LM block. When using the greasing hole, contact THK.

Note) The greasing interval is longer than that of full-roller types because of the roller cage effect. However, the actual greasing interval may vary depending on the service environment, such as a high load and high speed. Contact THK for details.

#### **Structure and Features**

Based on Caged Roller LM Guide model SRG, this model has a wider rail and two rows of LM rail mounting holes to achieve high mounting strength and mounting stability. SRW is an ultra-high rigidity Roller Guide that uses roller cages to allow low-friction, smooth motion and achieve long-term maintenance-free operation.

#### [Ultra-high Rigidity]

Since it has a wide rail and can be secured on the table using two rows of mounting bolts, the mounting strength is significantly increased. In addition, since the crosswise raceway distance (L) is large, model SRW is structurally strong against a moment load (Mc moment) in the rolling direction. Furthermore, model SRW uses rollers that show little elastic deformation as its rolling elements, and the overall length of each roller is 1.5 times greater than the diameter, thus to increase the rigidity.

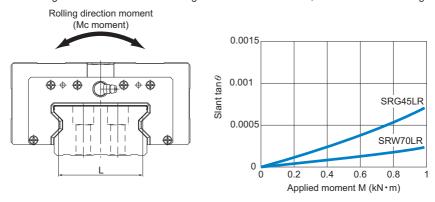

Fig.1 Result of Comparison between Models SRW and SRG in Moment Rigidity in the Rolling Direction (Mc Moment)

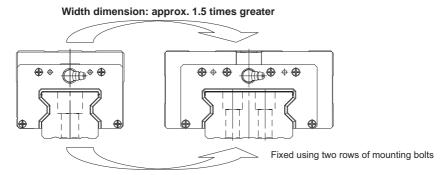

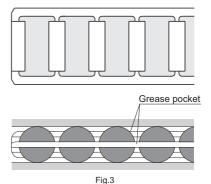

Fig.2 Comparison between Models SRW and SRG in Cross Section

#### [Smoothness Achieved through Skewing Prevention]

The roller cage allows rollers to form an evenly spaced line while circulating, thus preventing the rollers from skewing as the block enters an loaded area. As a result, fluctuation of the rolling resistance is minimized, and stable, smooth motion is achieved.

#### [Long-term Maintenance-free Operation]

Use of the roller cage eliminates friction between rollers and enables the lubricant to be retained in grease pockets formed between adjacent rollers. As the rollers circulate, the grease pocket serves to provide the required amount of lubricant to the contact curvature of the spacer and the roller, thus to achieve long-term maintenance-free operation.

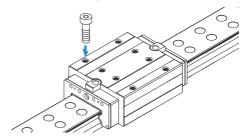

### **Types and Features**

### **Model SRW-LR**

The LM block has tapped holes.

#### Specification Table⇒A1-446

### **Permissible Error of the Mounting Surface**

The Caged Roller LM Guide Model SRW features high rigidity since the raceway is made up of rollers, preventing roller skew due to the roller cage. However, high machining accuracy is required in the mounting surface. If the error on the mounting surface is large, it will affect the rolling resistance and the service life. The following shows the maximum permissible value (limit value) according to the radial clearance.

Table1 Error in Parallelism (P) between Two Rails

Note) 1. Model SRW is attached with "SS" as standard.

This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)
 For the standard LM rail length, see Table4 on 1-448.

4. The greasing hole on the top face and the pilot hole of the side nipple\*\* are not drilled through in order to prevent foreign material from entering the block.

For details, see 1-449.

5. The removing/mounting jig is not provided as standard. When desiring to use it, contact THK.

The maximum length under "Length\*" indicates the standard maximum length of an LM rail. (See M1-448.)

Static permissible moment\*: 1 block: static permissible moment value with 1 LM block

Double blocks: static permissible moment value with 2 blocks closely contacting with each other

### Standard Length and Maximum Length of the LM Rail

Table4 shows the standard lengths and the maximum lengths of model SRW variations. If the maximum length of the desired LM rail exceeds them, jointed rails will be used.

For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus causing an adverse impact to accuracy.

If desiring connected use of this model, be sure to indicate the overall length so that we can manufacture the product without leaving a level difference in the joint.

Note1) The maximum length varies with accuracy grades. Contact THK for details.

Note2) If jointed rails are not allowed and a greater length than the maximum values above is required, contact THK.

### **Greasing Hole**

#### [Greasing Hole for Model SRW]

Model SRW allows lubrication from both the side and top faces of the LM block. The greasing hole of standard types is not drilled through in order to prevent foreign material from entering the LM block. When using the greasing hole, contact THK.

Unit: mm

| Model No. |     | Pilot h        | ole for side | nipple | Applicable | Greasing hole on the top face |          |     |            |

Note) The greasing interval is longer than that of full-roller types because of the roller cage effect. However, the actual greasing interval may vary depending on the service environment, such as a high load and high speed. Contact THK for details

## **Designing the Guide System**

THK offers various types of LM Guides in order to meet diversified conditions. Supporting ordinary horizontal mount, vertical mount, inverted mount, slant mount, wall mount and single-axis mount, the wide array of LM Guide types makes it easy to achieve a linear guide system with a long service life and high rigidity while minimizing the required space for installation.

It is necessary to consider the position in the LM block where the grease nipple or the piping joint should be attached according to the mounting orientation.

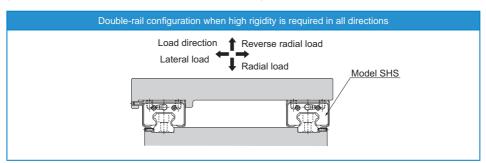

If the mounting orientation is other than horizontal use, the lubricant may not reach the raceway completely. Be sure to let THK know the mounting orientation and the exact position in each LM block where the grease nipple or the piping joint should be attached.

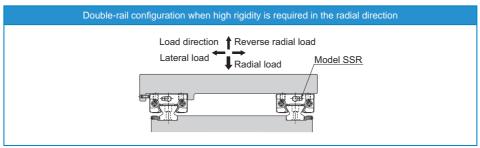

Even with an LM Guide with seals, the internal lubricant gradually seeps out during operation. Therefore, the system needs to be lubricated at an appropriate interval according to the conditions. For the mounting orientation and the lubrication, see **A1-12** and **A24-2**, respectively.

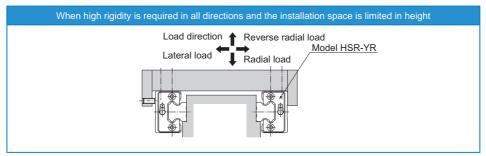

**Designing the Guide System** 

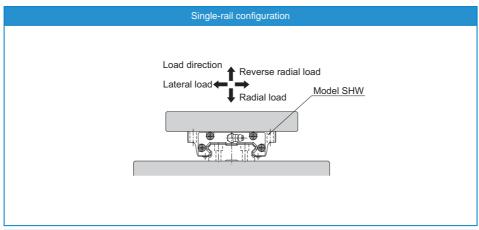

### **Examples of Arrangements of the Guide System**

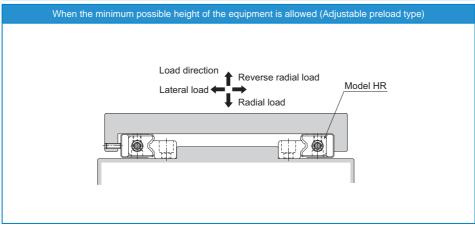

The following are representative guide systems and arrangements when installing the LM Guide. (For indication of the reference surface, see **A1-471**.)

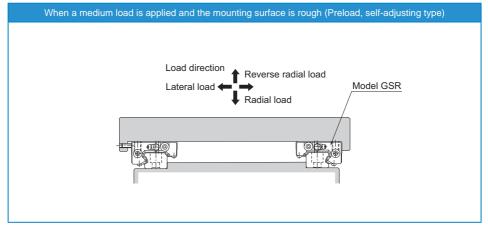

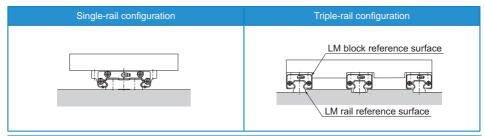

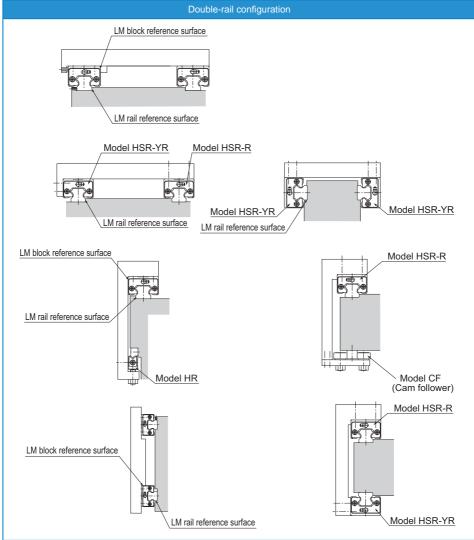

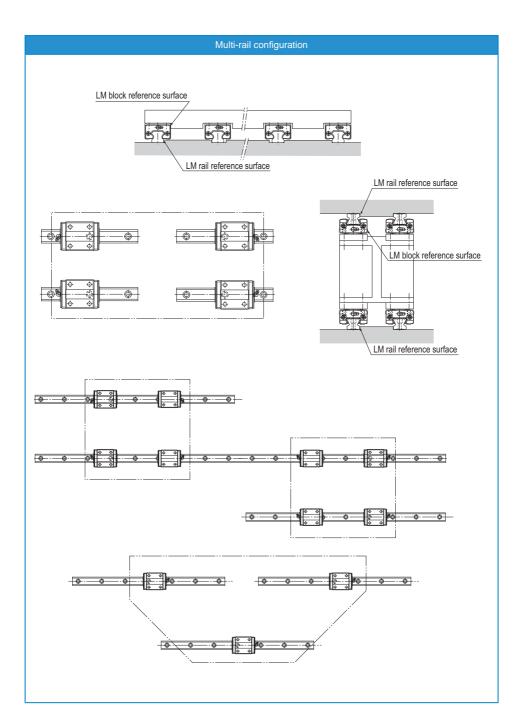

Designing the Guide System

Designing the Guide System

### Method for Securing an LM Guide to Meet the Conditions

LM Guides are categorized into groups of types by mounting space and structure: a group of types to be mounted with bolts from the top, and another of types to be mounted from the bottom. LM rails are also divided into types secured with bolts and those secured with clamps (model JR). This wide array of types allows you to make a choice according to the application.

There are several ways of mounting the LM Guide as shown in Table1. When the machine is subject to vibrations that may cause the LM rail(s) or LM blocks to loosen, we recommend the securing method indicated by Fig.1 on **\( \text{A1-456} \)**. (If 2 or more rails are used in parallel, only the LM block on the master rail should be secured in the crosswise direction.) If this method is not applicable for a structural reason, hammer in knock pins to secure the LM block(s) as shown in Table2 on **\( \text{A1-456} \)** When using knock pins, machine the top/bottom surfaces of the LM rail by 2 to 3 mm using a carbide end mill before drilling the holes since the surfaces are hardened.

Designing a Mounting Surface

# **Designing a Mounting Surface**

### **Designing a Mounting Surface**

If particularly high accuracy is required for the machine to which an LM Guide is to be mounted, it is necessary to mount the LM rail with high accuracy. To achieve the desired accuracy, be sure to design the mounting surface while taking the following points into account.

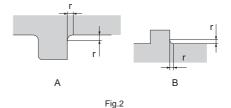

#### [Corner Shape]

If the corner on the surface on which the LM rail or LM block is to be mounted is machined to be shaped R, which is greater than the chamfer dimension of the LM rail or LM block, then the rail or the block may not closely contact its reference surface. Therefore, when designing a mounting surface, it is important to carefully read the description on the "corner shape" of the subject model . (Fig.2)

#### [Perpendicularity with the Reference Surface]

If the perpendicularity between the base mounting surface for the LM rail or the LM block and the reference surface is not accurate, the rail or the block may not closely contact the reference surface. Therefore, it is important to take into account an error of the perpendicularity between the mounting surface and the reference surface. (Fig.3)

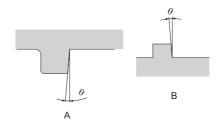

Fig.3

#### [Dimensions of the Reference Surface]

When designing the reference surface, be sure to take into account the height and the thickness of the datum area. If the datum area is too high, it may interfere with the LM block. If it is too low, the LM rail or the LM block may not closely contact the reference-surface depending on the chamfer of the rail or the block. Additionally, if the datum area is too thin, the desired accuracy may not be obtained due to poor rigidity of the datum area when a lateral load is applied or when performing positioning using a lateral mounting bolt. (Fig.4)

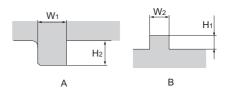

Fig.4

#### [Dimensional Tolerance between the Reference Surface and the Mounting Hole]

If the dimensional tolerance between the reference surface of the LM rail or the LM block and the mounting hole is too large, the rail or the block may not closely contact the reference surface when mounted on the base.

Normally, the tolerance should be within  $\pm 0.1$  mm depending on the model. (Fig.5)

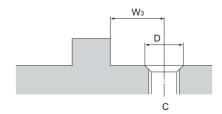

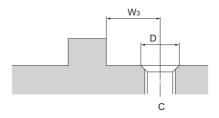

Fig.5

#### [Chamfer of the Tapped Mounting Hole]

To mount the LM rail, the mounting surface needs to be tapped and the tapped hole has to be chamfered. If the chamfer of the tapped hole is too large or too small, it may affect the accuracy. (Fig.6)

Guidelines for the chamfer dimension: Chamfer diameter D = nominal diameter of the bolt + pitch

Example: Chamfer diameter D with M6 (pitch): D = 6 + 1 = 7

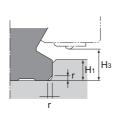

Fia.6

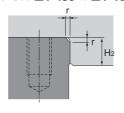

Designing a Mounting Surface

### **Shoulder Height of the Mounting Base and the Corner Radius**

Normally, the mounting base for the LM rail and the LM block has a reference-surface on the side face of the shoulder of the base in order to allow easy installation and highly accurate positioning. The height of the datum shoulder varies with model numbers. See **A1-459** to **A1-465** for details.

The corner of the mounting shoulder must be machined to have a recess, or machined to be smaller than the corner radius "r," to prevent interference with the chamfer of the LM rail or the LM block. The corner radius varies with model numbers. See **A1-459** to **A1-465** for details.

Unit: mm

| Model<br>No. | Corner radius r(max) | Shoulder<br>height for<br>the LM rail<br>H <sub>1</sub> | Maximum<br>shoulder height<br>for the LM block<br>H <sub>2</sub> | H₃   | D   |
|--------------|----------------------|---------------------------------------------------------|------------------------------------------------------------------|------|-----|
| 15 X         | 0.5                  | 3.8                                                     | 5.5                                                              | 4.5  | 0.3 |
| 20 X         | 0.5                  | 5                                                       | 7.5                                                              | 6    | 0.3 |
| 25 X         | 1                    | 5.5                                                     | 8                                                                | 6.8  | 0.4 |
| 30 X         | 1                    | 8                                                       | 11.5                                                             | 9.5  | 0.4 |
| 35 X         | 1                    | 9                                                       | 16                                                               | 11.5 | 0.4 |

Note) When closely contacting the LM block with the datum shoulder, the resin layer may stick out from the overall width of the LM block by the dimension D. To avoid this, machine the datum shoulder to have a recess or limit the datum shoulder's height below the dimension H<sub>2</sub>.

### **Permissible Error of the Mounting Surface**

The LM Guide allows smooth straight motion through its self-aligning capability even when there is a slight distortion or error on the mounting surface.

#### [Error Allowance in the Parallelism between Two Rails]

A mounting surface error of the LM Guide may affect the service life. The following tables show approximate error allowances in parallelism (P) between two rails in general use.

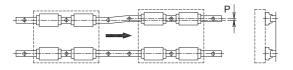

Fig.18 Error Allowance in Parallelism (P) between Two Rails

#### [Flatness of the Mounting Surface]

The following tables show errors in flatness of the mounting surface with models SRS, RSR and RSR-W that will not affect their service lives in normal operation. Note that if the flatness of the mounting surface is poorly established for models other than those above, it may affect the service life.

#### [Model SRS]

Unit: mm

#### [Models RSR, RSR-W and RSR-Z]

Unit: mm

| Model No. | Flatness error |
|-----------|----------------|
| 5         | 0.015/200      |
| 7         | 0.025/200      |
| 9         | 0.035/200      |
| 12        | 0.050/200      |
| 15        | 0.060/200      |
| 20        | 0.070/200      |
| 25        | 0.070/200      |

#### [Model SR-MS]

Unit: mm

| Model No. | Flatness error |
|-----------|----------------|
| 15        | 0.020/200      |
| 20        | 0.020/200      |

| Model No. | Flatness error |
|-----------|----------------|
| 3         | 0.012/200      |
| 5         | 0.015/200      |
| 7         | 0.025/200      |
| 9         | 0.035/200      |
| 12        | 0.050/200      |
| 14        | 0.060/200      |
| 15        | 0.060/200      |
| 20        | 0.110/200      |
| 7 A       | 0.100/200      |
| 9 A       | 0.160/200      |
| 12 A      | 0.200/200      |
| 15 A      | 0.250/200      |
| 20 A      | 0.300/200      |

Note1) With the mounting surface, multiple accuracies are combined in many cases. Therefore, we recommend using 70% or less of the values above.

Note2) The above figures apply to normal clearances. When using two or more rails with clearance C1, we recommend using 50% or less of the values above.

#### **Point of Design**

**Designing a Mounting Surface** 

#### [Error Allowance in Vertical Level between Two Rails]

The values in the tables on **\( \Delta 1-469 \)** and **\( \Delta 1-470 \)** represent error allowances in vertical level between two rails per axis-to-axis distance of 500 mm and are proportionate to axis-to-axis distances (200 mm for model RSR).

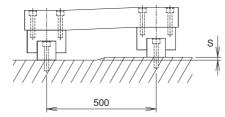

Fig.19 Error Allowance in Vertical Level (S) between Two Rails

#### **Point of Design**

Designing a Mounting Surface

# Marking on the Master LM Guide and Combined Use

#### [Marking on the Master LM Guide]

All LM rails mounted on the same plane are marked with the same serial number. Of those LM rails, the one marked with "KB" after the serial number is the master LM rail. The LM block on the master LM rail has its reference surface finished to a designated accuracy, allowing it to serve as the positioning reference for the table. (See Fig.20.)

LM Guides of normal grade are not marked with "KB." Therefore, any one of the LM rails having the same serial number can be used as the master LM rail.

Master LM Guide

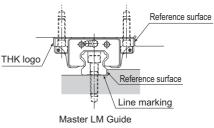

Subsidiary LM Guide

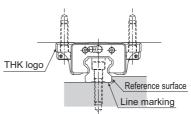

Fig.20 Master LM Guide and Subsidiary LM Guide

#### [Markings on the Reference Surface]

In the LM Guide, the reference surface of the LM block is opposite the surface marked with the THK logo, and that of the LM rail is on the surface marked with a line (see Fig.21). If it is necessary to reverse the reference surface of the LM rail and block, or if the grease nipple must be oriented in the opposite direction, specify it.

Subsidiary LM Guide

Fig.21 Markings on the Reference Surface

#### [Serial Number Marking and Combined Use of an LM Rail and LM Blocks]

An LM rail and LM block(s) used in combination must have the same serial number. When removing an LM block from the LM rail and reinstalling the LM block, make sure that they have the same serial number and the numbers are oriented in the same direction. (Fig.22)

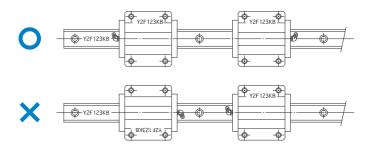

Fig.22 Serial Number Marking and Combined Use of an LM Rail and LM Blocks

#### [Use of Jointed Rails]

When a long LM rail is ordered, two or more rails will be jointed together to the desired length. When jointing rails, make sure that the joint match marks shown in Fig.23 are correctly positioned. When two LM Guides with connected rails are to be arranged in parallel to each other, the two LM Guides will be manufactured so that the two LM Guides are axisymmetrically aligned.

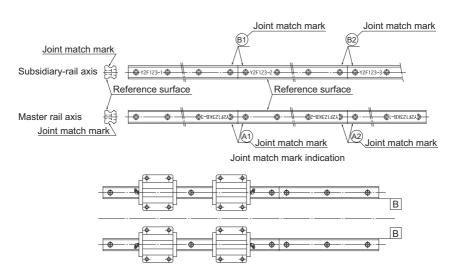

Fig.23 Use of Jointed Rails

LM Guide

Dedicated LM cover --- applicable to models HSR25 to 55, Model HSR Grade Ct --- supports SS only

Inner seal --- applicable to models HSR30 to 85

\*7 Model SR : ZZ, KK --- grease nipple cannot be attached to models SR15, 20.

Dedicated cap C --- applicable to models SR15 to 85, dedicated cap GC --- applicable to models SR20 to 85,

Stainless steel LM Guides --- applicable to models SR15 to 35

\*8 Model NR : DD,ZZ,KK and HH --- side nipple required for model NR100, Plate cover SV --- applicable to models NR35 to 75,

Dedicated cap C and GC --- not applicable to only model NR75

<sup>\*1</sup> Model SHS : Dedicated cap GC --- not applicable to only model SHS15
\*2 Model SSR : Dedicated cap GC --- not applicable to model SSR15, Stainless steel LM Guides --- applicable to XV, XW

<sup>\*3</sup> Model SHW : GG, PP --- applicable to only model SHW21, Dedicated cap GC --- applicable to SHW35, 50

<sup>\*4</sup> Model SRS : Dedicated cap C --- applicable to models SRS9W, 12, 15, 20, 25 \*5 Model SCR : Dedicated cap GC --- not applicable to only model SCR15

<sup>\*6</sup> Model HSR : GG --- applicable to model HSR25, Steel tape SP --- applicable to models HSR15 to 100, Dedicated cap C --- applicable to models HSR12 to 100,

Dedicated cap GC --- applicable to models HSR20 to 100,

#### Table of Supported Options by Models

Symbols in the table ○: Applicable △: Applicable depending on model (see note)
★: Recommended by THK (standard stock item)

\*9 Model NRS : DD,ZZ,KK and HH --- side nipple required for model NRS100, Plate cover SV --- applicable to models NRS35 to 75,

Dedicated cap C and GC --- not applicable to only model NRS75

\*10 Model HRW: Dedicated cap C --- applicable to models HRW14 to 60, Dedicated cap GC --- applicable to models HRW35, 50, 60,

Dedicated bellows --- applicable to models HRW17 to 50, Stainless steel LM Guides --- applicable to models HRW12 to 35

Laminated Contact Scraper LaCS

# Laminated Contact Scraper LaCS

- ●For the supported models, see the table of options by model number on △1-474.
- ●For the LM block dimension (dimension L) with LaCS attached, see △1-484 to △1-491.
- ●For the resistance of LaCS, see ▲1-500.

For locations with adverse environment, Laminated Contact Scraper LaCS is available. LaCS removes minute foreign material adhering to the LM rail in multiple stages and prevents it from entering the LM block with laminated contact structure (3-layer scraper).

#### [Features]

- Since the 3 layers of scrapers fully contact the LM rail, LaCS is highly capable of removing minute foreign material.
- Since it uses oil-impregnated, foam synthetic rubber with a self-lubricating function, low friction resistance is achieved.

| Symbol | Contamination Protection Accessories                                                          |
|--------|-----------------------------------------------------------------------------------------------|
| SSHH   | With end seal + side seal + inner seal + LaCS                                                 |
| DDHH   | With double seals + side seal + inner seal + LaCS                                             |

| ККНН   | With double seals + side seal + inner seal + metal scraper + LaCS                             |
| JJHH*  | With end seal + side seal + inner seal + LaCS + protector (serving also as metal scraper)     |
| TTHH*  | With double seals + side seal + inner seal + LaCS + protector (serving also as metal scraper) |

<sup>\*</sup> JJHH and TTHH are available only for models SVR/SVS.

Note) HH type (with LaCS) of models SVR/SVS is provided with the protector (see **A1-482**).

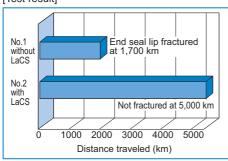

Contact THK if you want to use the Protector with other options.

Large amount of foreign matter has entered the raceway

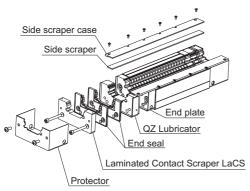

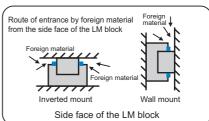

No foreign matter entering the raceway observed

Side Scraper

# Side Scraper

- For supported models: models SVR/SVS
- For the resistance of side scraper, see ▲1-501.
- For the LM block dimension (dimension L) with side scraper attached, see △1-484.

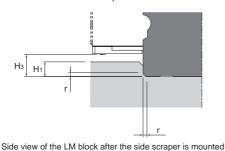

Outline view (Ex: in case of QZTTHHYY type)

#### [Features]

- Minimizes foreign material entering from the side of the LM Guide in a harsh environment.
- Demonstrates a dust protection effect in inverted or wall mount.

The shoulder height of the mounting surface and the corner radius after the side scraper is mounted

Unit: mm

Note) Note that the side scraper is not sold alone.

Model number coding

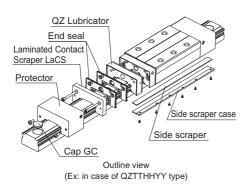

SVR45 LR 1 QZ JJHH YY C1 +1200L

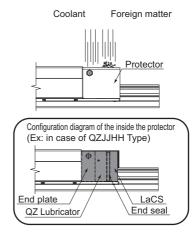

With side scraper\*

The side scraper can accommodate various options of dust control accessories and lubrication accessories. For details, contact THK.

# **Protector**

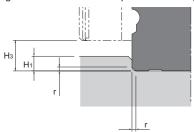

- For the supported models: models SVR/SVS
- ●HH type (with LaCS) of models SVR/SVS is provided with the protector.
- For the LM block dimension (dimension L) with protector attached, see 🖾 1-484.

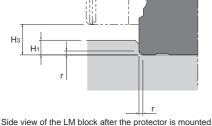

#### [Features]

• The protector minimizes the entrance of foreign material even in harsh environments where foreign material such as fine particles and liquids are present.

Note) Contact THK if you want to use the protector with other options.

Light-Resistance Contact Seal LiCS

# **Light-Resistance Contact Seal LiCS**

- ●For the supported models, see the table of options by model number on △1-474.
- For the LM block dimension (dimension L) with LiCS attached, see △1-495.
- ●For the resistance of LiCS, see ▲1-501.

LiCS is a light sliding resistance contact seal. It is effective in removing dust on the raceway and retaining a lubricant such as grease. It achieves extremely low drag and smooth, stable motion.

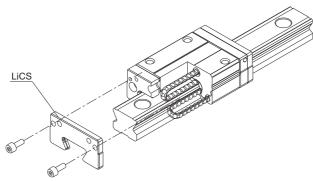

Fig.1 Structural Drawing of SSR + LiCS

#### [Features]

Light-Resistance Contact Seal LiCS is a seal that uses a light-resistance material in its sealing element and contacts the LM rail raceway to achieve low drag resistance. It is optimal for applications where low drag resistance is required, such as semiconductor-related devices, inspection devices and OA equipment all of which are used in favorable environments.

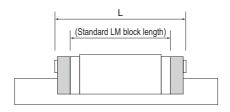

- Since the sealing element contacts the LM rail raceway, it is effective in removing dust on the raceway.
- Use of oil-impregnated, expanded synthetic rubber, which has excellent self-lubricating property, achieves low drag resistance.

| 224.9* |
| 284.9* |
|        |

<sup>\*</sup>The overall LM block length (L) of YY type (with side scraper) is also the same.

Note1) The standard overall length may include the dimension of the end seal depending on the model. If you are considering using a type without an end seal, contact THK for details.

Note2) For models SVR/SVS, we recommend attaching a protector. For the dimensions of ZZHH and KKHH, contact THK. For details of the symbols of options, see **II-510**.

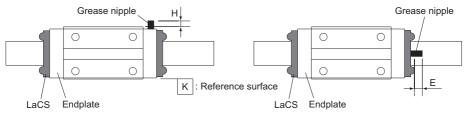

Model number coding KKHH C0 +1200L Symbol for No. Symbol for LM rail With QZ With Type of LM block LM rail length Model of rails used on steel number Lubricator (\*1) (in mm) jointed use the same plane (\*5) Radial clearance Accuracy symbol (\*4) Normal grade (No Symbol) symbol (\*3) No. of LM blocks Contamination Normal (No symbol) used on the same High accuracy grade (H)
Precision grade (P)/Super precision grade (SP)
Ultra precision grade (UP) protection Light preload (C1) accessory symbol (\*2) rail Medium preload (C0)

(\*1) See M1-502. (\*2) See M1-510. (\*3) See M1-70. (\*4) See M1-76. (\*5) See M1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

# Incremental Dimension with Grease Nipple (When LaCS is Attached)

Grease nipple mounting location for models SHS, SSR, SVR/SVS, SRG and NR/NRS

Grease nipple mounting location for models SHW, SRS and HSR

|     | 35LA/LB/LR/HA/HB | 8                                          | B-M6F       |

Note1) When desiring the mounting location for the grease nipple other than the above, contact THK.

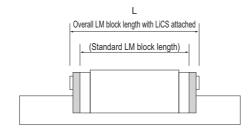

Note2) Those models equipped with QZ Lubricator cannot have a grease nipple. When desiring both QZ Lubricator and a grease nipple, contact THK.

Note3) When desiring a grease nipple for model SHW or SRS without QZ Lubricator, indicate "with grease nipple" when placing an order. (If not, a grease nipple will not be attached.)

Note4) Model HSR15 attached with ZZ or KK cannot have a grease nipple. Contact THK for details.

Note1) Each resistance value in the table only consists of that of LaCS, and does not include sliding resistances of seals and

Note2) For the maximum service speed of LaCS, contact THK.

Note3) Ht type (with LaCS) of models SVR/SVS is provided with the protector (see 

■1-482).

Contact THK if you want to use the Protector with other options.

Dimensions of Each Model with an Option Attached

# **Maximum resistance for LiCS**

Unit: N

| Model No. |     | Maximum resistance for LiCS |
|-----------|-----|-----------------------------|
| SSR       | 15X | 1                           |
|           | 20X | 1.1                         |
|           | 25X | 1.6                         |
|           | 30X | 1.6                         |
|           | 35X | 2                           |
| SRG       | 15  | 0.7                         |

Note) The value indicates the sliding resistance of two LiCS units per LM block and does not include the sliding resistances of the LM block and the side seals.

# Maximum resistance for the side scraper

Unit: N

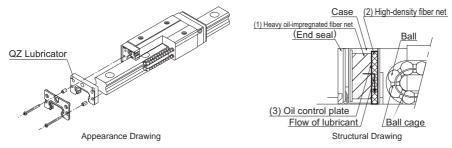

| Model No. |     | Maximum Resistance for the side scraper (KKHHYY/TTHHYY Option) |
|-----------|-----|----------------------------------------------------------------|
|           | 25  | 4.4                                                            |
|           | 25L | 5.2                                                            |
|           | 30  | 4.7                                                            |
|           | 30L | 5.5                                                            |
|           | 35  | 4.6                                                            |
| SVR/      | 35L | 5.5                                                            |
| SVS       | 45  | 5.1                                                            |
|           | 45L | 6.1                                                            |
|           | 55  | 5.3                                                            |
|           | 55L | 6.3                                                            |
|           | 65  | 5.4                                                            |
|           | 65L | 6.9                                                            |

# **QZ** Lubricator

- ●For the supported models, see the table of options by model number on 🖾 1-474.
- ●For the LM block dimension with QZ attached, see 🖾 1-505 to 🖾 1-508.

QZ Lubricator feeds the right amount of lubricant to the raceway on the LM rail. This allows an oil film to continuously be formed between the rolling element and the raceway, and drastically extends the lubrication and maintenance intervals.

The structure of QZ Lubricator consists of three major components: (1) a heavy oil-impregnated fiber net (function to store lubricant), (2) a high-density fiber net (function to apply lubricant to the raceway) and (3) an oil-control plate (function to adjust oil flow). The lubricant contained in QZ Lubricator is fed by the capillary phenomenon, which is used also in felt pens and many other products, as the fundamental principle.

#### [Features]

- Since it supplements an oil loss, the lubrication maintenance interval can be significantly extended.
- Eco-friendly lubrication system that does not contaminate the surrounding area since it feeds the right amount of lubricant to the ball raceway.

| Symbol  | Contamination Protection Accessories                                                               |
|---------|----------------------------------------------------------------------------------------------------|
| QZUU    | With end seal + QZ                                                                                 |
| QZSS    | With end seal + side seal + inner seal + QZ                                                        |
| QZDD    | With double seals + side seal + inner seal + QZ                                                    |
| QZZZ    | With end seal + side seal + inner seal + metal scraper + QZ                                        |
| QZKK    | With double seals + side seal + inner seal + metal scraper + QZ                                    |
| QZGG    | With LiCS + QZ                                                                                     |
| QZPP    | With LiCS + side seal + inner seal + QZ                                                            |
| QZSSHH  | With end seal + side seal + inner seal + LaCS + QZ                                                 |
| QZDDHH  | With double seals + side seal + inner seal + LaCS + QZ                                             |
| QZZZHH  | With end seal + side seal + inner seal + metal scraper + LaCS + QZ                                 |
| QZKKHH  | With double seals + side seal + inner seal + metal scraper + LaCS + QZ                             |
| QZJJHH* | With end seal + side seal + inner seal + LaCS + QZ + protector (serving also as metal scraper)     |
| QZTTHH* | With double seals + side seal + inner seal + LaCS + QZ + protector (serving also as metal scraper) |

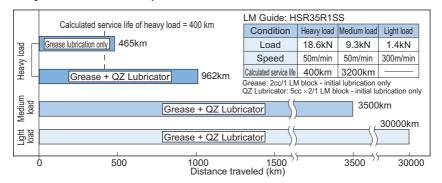

<sup>\*</sup> QZJJHH and QZTTHH are available only for models SVR/SVS.

Note) HH type (with LaCS) of models SVR/SVS is provided with the protector (see **A1-482**). Contact THK if you want to use the Protector with other options.

**QZ** Lubricator

#### Significantly Extended Maintenance Interval

Attaching QZ Lubricator helps extend the maintenance interval throughout the whole load range from the light load area to the heavy load area.

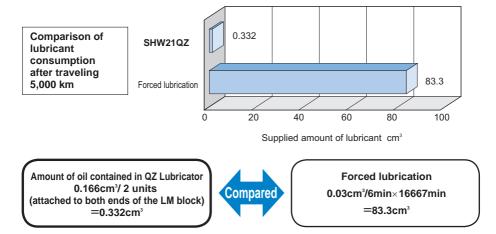

LM Guide Running Test without Replenishment of Lubricant

#### Effective Use of Lubricant

Since the lubricator feeds the right amount of lubricant to the ball raceway, lubricant can be used efficiently.

[Test conditions] speed: 300 m/min

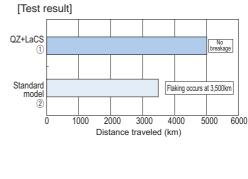

Lubricant consumption is 1/250 less than forced lubrication.

### • Effective in Helping Lubrication under Severe Environments

A 5,000 km durability test was conducted under severe environments (containing coolant and contaminated environment).

[Test conditions]

\* The overall LM block length (L) of YY type (with side scraper) is also the same.

Note) For models SVR/SVS, we recommend attaching a protector. For the dimensions of QZZZHH and QZKKHH, contact THK. For details of the symbols of options, see **1-510**.

Precision grade (P)/Super precision grade (SP)
Ultra precision grade (UP)

(\*1) See M1-502. (\*2) See M1-510. (\*3) See M1-70. (\*4) See M1-76. (\*5) See M1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

**Options**QZ Lubricator

# **List of Parts Symbols**

- For supported model numbers, see the correspondence table of options by model number on **A1-474**.
- For the overall block length (dimension L) of each model with seal options attached, see **A1-484** to **A1-491**.
- ●For the overall block length (dimension L) with the QZ option attached, see ▲1-505 to ▲1-508.

### [Symbols for Seals and Metal Scraper]

| Symbol    | Configuration of seal and metal scraper                    |
|-----------|------------------------------------------------------------|
| No Symbol | Without seal                                               |
| UU        | End seal                                                   |
| SS        | With end seal + side seal + inner seal                     |
| DD        | With double seals + side seal + inner seal                 |
| ZZ        | With end seal + side seal + inner seal + metal scraper     |
| KK        | With double seals + side seal + inner seal + metal scraper |

### [Symbols for QZ Lubricator and Laminated Contract Scraper LaCS]

| Symbol   | Configuration of options                                 | Example  |
|----------|----------------------------------------------------------|----------|
| * * HH   | (Seal and metal scraper) + LaCS                          | UUHH     |
| * * HHYY | (Seal and metal scraper) + LaCS + side scraper           | DDHHYY   |
| QZ**     | With QZ + (seal and metal scraper)                       | QZZZ     |
| QZ**HH   | With QZ + (seal and metal scraper) + LaCS                | QZZZHH   |
| QZ**HHYY | With QZ + (seal and metal scraper) + LaCS + side scraper | QZKKHHYY |

Note) \* \* in the table represents the symbol for a seal and metal scraper.

### [Symbols for Light-Resistance Contact Seal LiCS]

| Symbol | Configuration of options                |  |  |  |  |  |  |  |  |  |
|--------|-----------------------------------------|--|--|--|--|--|--|--|--|--|
| GG     | S                                       |  |  |  |  |  |  |  |  |  |
| PP     | With LiCS + side seal + inner seal      |  |  |  |  |  |  |  |  |  |
| QZGG   | With QZ + LiCS                          |  |  |  |  |  |  |  |  |  |
| QZPP   | With QZ + LiCS + side seal + inner seal |  |  |  |  |  |  |  |  |  |

### [Symbols for Protector]

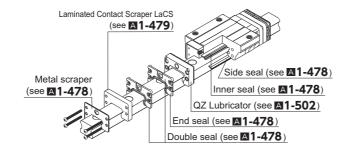

<sup>\*</sup> Supported models: SVR/SVS

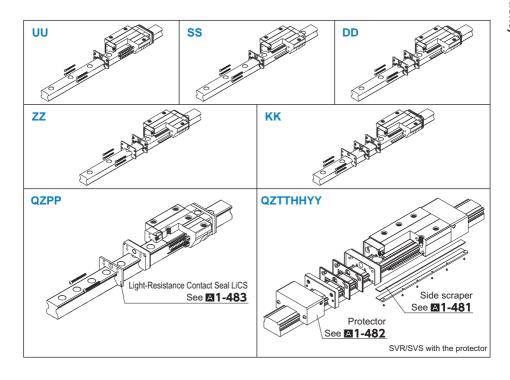

| Symbol   | Configuration of options                                                                                              |
|----------|-----------------------------------------------------------------------------------------------------------------------|
| JJHH     | With End seal + side seal + inner seal + LaCS + protector (also has a metal scraper function)                         |
| TTHH     | With Double seals + side seal + inner seal + LaCS + protector (also has a metal scraper function)                     |
| JJHHYY   | With End seal + side seal + inner seal + LaCS + protector (also has a metal scraper function) + side scraper          |
| TTHHYY   | With Double seals + side seal + inner seal + LaCS + protector (also has a metal scraper function) + side scraper      |
| QZJJHH   | With QZ + end seal + side seal + inner seal + LaCS + protector (also has a metal scraper function)                    |
| QZTTHH   | With QZ + double seals + side seal + inner seal + LaCS + protector (also has a metal scraper function)                |
| QZJJHHYY | With QZ + end seal + side seal + inner seal + LaCS + protector (also has a metal scraper function) + side scraper     |
| QZTTHHYY | With QZ + double seals + side seal + inner seal + LaCS + protector (also has a metal scraper function) + side scraper |

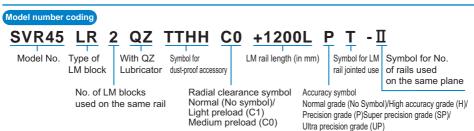

Note) HH type (with LaCS) of models SVR/SVS is provided with the protector (see **\( \textit{M1-482} \)**). Protector also serves as metal scraper. Contact THK if you want to use the Protector with other options.

<sup>\*</sup> Use self-tapping screws as the mounting screws on the LM block side of the JSH15.

Note2) For lubrication when using the dedicated bellows, contact THK.

Note3) When using the dedicated bellows, the LM block and LM rail need to be machined so that the bellows can be mounted. Be sure to indicate that the dedicated bellows is required when ordering the LM Guide.

### Model number coding

JSH35 - 60/420

Model number of bellows for SHS35

Dimensions of the bellows (length when compressed / length when extended)

Note) The length of the bellows is calculated as follow.

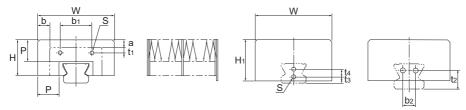

Lmin =  $\frac{S}{(A-1)}$  S: Stroke length (mm)

Lmax = Lmin · A A: Extension rate

Note1) When desiring to use the dedicated bellows other than in horizontal mount (i.e., vertical, wall and inverted mount), or when desiring a heat-resistant type of bellows, contact THK.

### [Dedicated Bellows JSSR-X for Model SSR]

The table below shows the dimensions of dedicated bellows JSSR-X for model SSR. Specify the corresponding model number of the desired bellows from the table.

Models SSR15X to 25X Models SSR30X and 35X

Note1) When desiring to use the dedicated bellows other than in horizontal mount (i.e., vertical, wall and inverted mount), or when desiring a heat-resistant type of bellows, contact THK.

Note2) For lubrication when using the dedicated bellows, contact THK.

Note3) For the mounting bolts marked with "\*", use tapping screws.

Note4) When using the dedicated bellows, the LM block and LM rail need to be machined so that the bellows can be mounted. Be sure to indicate that the dedicated bellows is required when ordering the LM Guide.

### Model number coding

## JSHW21 - 60/360

Model number of bellows for SHW21

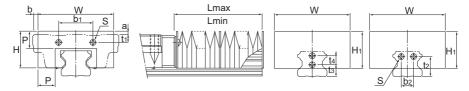

Dimensions of the bellows (length when compressed / length when extended)

Note) The length of the bellows is calculated as follow.

S: Stroke length (mm) Lmax = Lmin · A A: Extension rate

### [Dedicated Bellows JH for Model HSR]

The table below shows the dimensions of dedicated bellows JH for model HSR. Specify the corresponding model number of the desired bellows from the table.

Models HSR15 to 30 Models HSR35 to 85

Note1) For model JH15's location marked with "\*", mounting bolts are used only on the LM rail side while the LM block side

uses M2 x 5 (nominal) tapping screws.

Note2) When desiring to use the dedicated bellows other than in horizontal mount (i.e., vertical, wall and inverted mount), or when desiring a heat-resistant type of bellows, contact THK.

Note3) For lubrication when using the dedicated bellows, contact THK.

Note4) When using the dedicated bellows, the LM block and LM rail need to be machined so that the bellows can be mounted. Be sure to indicate that the dedicated bellows is required when ordering the LM Guide.

### Model number coding

JH25 - 60/420

Model number of bellows for HSR25

Dimensions of the bellows (length when compressed / length when extended)

Note) The length of the bellows is calculated as follow.

S: Stroke length (mm)

 $Lmax = Lmin \cdot A$ A: Extension rate

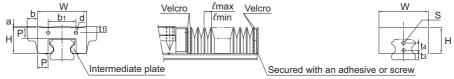

**Dedicated Bellows** 

### [Dedicated Bellows DH for Model HSR]

For models HSR15, 20 and 25, bellows DH, which has the following features, is also available other than the dedicated bellows JH. Specify the corresponding model number of the desired bellows from the table.

#### Features

- (1) Has a width and height smaller than the conventional product so that any part of the bellows does not stick out of the top face of the LM block. The extension rate is equal to or greater than that of the conventional type.
- (2) Has an intermediate plate for each crest so that it will not easily lift and the bellows can be used with vertical mount, wall mount and slant mount.
- (3) Operable at high speed, at up to 120 m/min.
- (4) Since a Velcro tape can be used to install the bellows, a regular-size model can be cut to the desired length, or two or more regular-size bellows can be taped together.
- (5) Can be installed using screws just as bellows JH. In this case, a plate (thickness: 1.6 mm) must be placed between the bellows and the LM bock. Contact THK for details.

Unit: mm

Note1) For lubrication when using the dedicated bellows, contact THK.

Note2) When using the dedicated bellows, the LM block and LM rail need to be machined so that the bellows can be mounted. Be sure to indicate that the dedicated bellows is required when ordering the LM Guide.

### Model number coding

# DH20 - 50/250

Model number of bellows for HSR20

Dimensions of the bellows (length when compressed / length when extended)

Note) The maximum length of the bellows itself is calculated as follows.

Lmax (Lmin) =  $\ell$ max ( $\ell$ mim) ×200

Example of calculating bellows dimensions:

When the stroke of model HSR20 is: \( \extit{s} = 530 \text{mm} \)

Lmin = 
$$\frac{\ell s}{(A-1)}$$
 =  $\frac{530}{4}$  = 132.5  $\stackrel{.}{=}$  135

 $Lmax = A \cdot Lmin = 5 \times 135 = 675$ 

Number of required crests n

$$n = \frac{Lmax}{P \cdot k} = \frac{675}{10 \times 1.3} = 51.9 = 52 \text{ crests}$$

 $Lmin = n \cdot \ell min + E = 52 \times 2.5 + 2 = 132$ 

(E indicates the plate thickness of 2)

Therefore, the model number of the required bellows is DH20-132/675.

Note2) When using the dedicated bellows, the LM block and LM rail need to be machined so that the bellows can be mounted. Be sure to indicate that the dedicated bellows is required when ordering the LM Guide.

### Model number coding

DS20 - 50/250

Model number of bellows for SR20 Dimensions of the bellows (length when compressed / length when extended) Note) The maximum length of the bellows itself is calculated as follows.

Lmax (Lmin) =  $\ell$ max ( $\ell$ min) ×200

Example of calculating bellows dimensions:

When the stroke of model SR20 is: \( \extit{s} = 530 \text{mm} \)

Lmin = 
$$\frac{\ell_s}{(A-1)}$$
 =  $\frac{530}{4}$  = 132.5  $\stackrel{.}{=}$  135

 $Lmax = A \cdot Lmin = 5 \times 135 = 675$ 

Number of required crests n

$$n = \frac{Lmax}{P \cdot k} = \frac{675}{10 \times 1.3} = 51.9 = 52 \text{ crests}$$

 $Lmin = n \cdot \ell min + E = 52 \times 2.5 + 2 = 132$ 

(E indicates the plate thickness of 2)

Therefore, the model number of the required bellows is DS20-132/675.

### [Simplified Bellows JN Dedicated for Models NR/NRS]

For models NR/NRS, bellows are available. Fig. 1 To gain a higher contamination protection effect, attach a telescopic cover outside the bellows after the bellows are mounted.

Note1) When desiring to use the bellows other than in horizontal mount (i.e., vertical, wall and inverted mount), or when desiring a heat-resistant type of bellows, contact THK

Note2) For lubrication when using the bellows, contact THK.
Note3) When using the bellows, the LM block and LM rail need to be machined so that the bellows can be mounted. Be sure to indicate that the bellows is required when ordering the LM Guide.

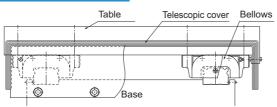

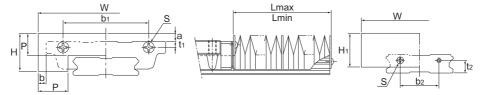

Fig.1 Example of Mounting the Bellows

**Dedicated Bellows** 

### [Dedicated Bellows JHRW for Model HRW]

The table below shows the dimensions of dedicated bellows JHRW for model HRW. Specify the corresponding model number of the desired bellows from the table.

Unit: mm

Note1) When desiring to use the dedicated bellows other than in horizontal mount (i.e., vertical, wall and inverted mount), or when desiring a heat-resistant type of bellows, contact THK.

Note2) For lubrication when using the dedicated bellows, contact THK.

Note3) When using the dedicated bellows, the LM block and LM rail need to be machined so that the bellows can be mounted. Be sure to indicate that the dedicated bellows is required when ordering the LM Guide.

Note4) In case of oil lubrication, be sure to let THK know the mounting orientation and the exact position in each LM block

where the piping joint should be attached.

For the mounting orientation and the lubrication, see \$\textstyle{1-12}\$ and \$\textstyle{24-2}\$, respectively.

### Model number coding

JSRG35 - 60/420

Model number of bellows for SRG35 Dimensions of the bellows (length when compressed / length when extended)

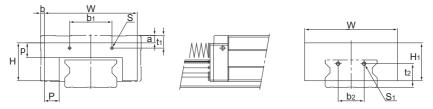

Note) The length of the bellows is calculated as follow.

S: Stroke length (mm)

Lmax = Lmin · A A: Extension rate

### [Dedicated Bellows JSRW for Model SRW]

The table below shows the dimensions of dedicated bellows JSRW for model SRW. Specify the corresponding model number of the desired bellows from the table.

Unit: mm

Cap C

# Cap C

If any of the LM rail mounting holes of an LM Guide is filled with cutting chips or foreign material, they may enter the LM block structure. Entrance of such foreign material can be prevented by covering each LM rail mounting hole with the dedicated cap.

Since the dedicated cap C for LM rail mounting holes uses a special synthetic resin with high oil resistance and high wear resistance, it is highly durable.

To attach the dedicated cap to the mounting hole, place a flat metal piece like one shown in Fig.1 on the cap and gradually hammer in the cap until it is on the same level as the top face of the LM rail. When attaching the dedicated cap C for LM rail mounting holes, do not remove any of the LM blocks from the LM rail.

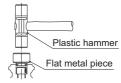

Fig.1 Cap C

Note) The dedicated cap for the LM rail mounting hole can be made of other materials (e.g., metal). Contact THK for details.

# Cap GC

GC caps are metal caps designed to cover the mounting holes in LM rails (in compliance with RoHS directives).

In harsh environments, preventing any influx of coolant or foreign material from the top face of the LM rail, coupled with the use of seals, will dramatically improve the contamination protection performance for the LM guide.

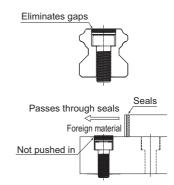

### [Features]

 Eliminating gaps around the mounting holes (countersunk holes)

The GC caps press into the mounting holes (countersunk holes) so that there are no gaps.

 Provides long-term sealing due to its excellent abrasion resistance

If a countermeasure such as a seal passes along the rail when there is foreign matter on the upper surface of the LM rail, it generates force pushing the GC cap in from above. In this situation, the cap does not get pushed inwards as it is easily strong enough to stay in place.

GC caps are highly effective in a range of different environments.

### Model number coding

#### C0 +1200L TTHH SVR45

Model No. Type of LM block With QZ Lubricator

Contamination protection accessory symbol

LM rail length (in mm) Radial clearance symbol Normal (No symbol) Light preload (C1)

Medium preload (C0)

With GC cap Symbol for No. of rails used on the same plane

Accuracy symbol Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP) Ultra precision grade (UP)

No. of LM blocks

used on the same rail

Note1) LM guides with GC caps are special rails.

Note2) They cannot be mounted on stainless steel LM rails or LM rails that have undergone surface treatment.

Note3) If this product will be used in special environments, such as in a vacuum or at very low or high temperatures, contact

Note4) GC caps are not sold individually. They are sold as a set with LM guides.

Note5) The openings of LM rail mounting holes are not chamfered. Take care not to injure your hands while working.

Note6) After fitting GC caps, the upper surface of the LM rail must be flattened and cleaned (wiped).

Note7) If you wish to fit GC caps for a single rail, use the sample model number configuration shown below.

(Example) SVR45LR2QZTTHHC0+1200LPGC With GC cap

\* Add the symbol (GC) to the end of the model number.

### Mounting method

The procedure for inserting a GC cap into a mounting hole consists of using a flat aligning fitting to gradually punch the cap into the hole until it is level with the upper surface of the LM rail, as shown in the figure. Fit GC caps without removing the LM rail from the LM block.

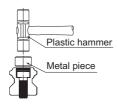

Plate Cover SV Steel Tape SP

| Plate Cover SV | Plate cover: SV Fixing-jig: NT  Slide piece Case fixing bolt Tension screw         | For the LM Guide, steel tapes are available as a means of contamination protection for machine tools. By covering the LM rail mounting holes with an ultra-thin stainless steel (SUS304) plate, the plate cover SV drastically increases sealability, thus to prevent the penetration of a coolant or cutting chips from the top face of the LM rail.  For the mounting method, see 1-532.  Note) When mounting the plate cover, the LM rail needs to be machined. Indicate that the plate cover is required when ordering the LM Guide.                                                                                      |
| Steel Tape SP  | Setscrew  End piece: EP Tap for attaching bellows  LM block mounting/ removing jig | For the LM Guide, steel tapes are available as a means of contamination protection for machine tools. By covering the LM rail mounting holes with an ultra-thin stainless steel (SUS304) plate, the steel tape SP drastically increases sealability, thus to prevent the penetration of a coolant or cutting chips from the top face of the LM rail. (When mounting the steel tape, end piece EP can be used as a means to secure the cover.) For the mounting method, see 1-533.  Note) When mounting the steel tape, the LM rail needs to be machined. Indicate that the steel tape is required when ordering the LM Guide. |

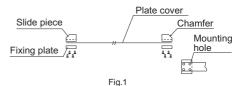

### [Mounting Procedure for Plate Cover SV]

- (1) Attach slide pieces to the plate cover.
  - Place the slide pieces on the plate cover with their chamfered sides facing outward, hold the plate cover with the slide pieces and the securing plates, and then secure them with countersunk screws.
- (2) Use an LM block mounting/removing jig to remove the LM block from the LM rail, and then mount the fixing-jigs onto the LM rail. Identify the positions of the mounting holes on the fixing jigs, then secure the jigs with hexagonal-socket-head type bolts.
- (3) Temporarily secure either slide piece. Insert either slide piece into one of the fixing-jigs, then attach the slide piece to the LM rail's end face using the tension adjustment bolt and gently secure the bolt until the bolt head is inside the fixing-jig.
- (4) Temporarily secure the other slide piece. Temporarily secure the other slide piece in the same manner as above.
- (5) Apply tension to the plate cover. Apply tension to the plate cover by evenly securing the tension adjustment bolts on both ends of the LM rail. Make sure there is only a small difference between the H and H' dimensions in Fig.5. If the difference is too large, there may be no interference left on either end.
- (6) Mount the LM block on the LM rail. Identity the reference surface of the LM rail and the LM block, then insert the LM rail into the LM block using the LM block mounting / removing jig.

Note1) When removing or the mounting the LM block, use much care not to let the balls fall off.

Note2) The plate cover is an ultra-thin stainless steel (SUS304) plate. When handing it, use much care not to bend it.

Note3) The plate cover is available for models NR/NRS35 to 100.

Fig.2

Fig.3

Fig.4

Fig.5

Plate Cover SV Steel Tape SP

### [Mounting Procedure for Steel Tape SP]

- (1) Use an LM block mounting/removing jig to remove the LM block from the LM rail.
- (2) Thoroughly degrease and clean the top face of the LM rail, to which the steel tape is to be adhered. For degreasing, use an adequately volatile detergent (e.g., industrial alcohol).
- (3) Carefully adhere the steel tape from the end with care not to let it bend or sag, while gradually peeling the release paper from the steel tape.
- (4) Have the steel tape settle on the rail by rubbing the tape. The adhesive strength increases with time. The adhering tape can be peeled off by pulling its end upward.
- (5) Mount the LM block onto the LM rail using the LM block mounting/removing jig.
- (6) Attach the end pieces on both ends of the LM rail and further secure the steel tape. When securing the end pieces, fasten only the setscrew on the top face of each end piece.

(The tap on the end face of the end piece is used for mounting bellows.)

Note1) The setscrew on the side face is used to lightly secure the bent steel tape. Be sure to stop fastening the screw as soon as it hits the end face, and do not force the screw further.

Note2) Since the steel tape is a thin steel plate, mishandling it may cause an accident such as cutting your finger. When handling it, take an effective safety measure such as wearing rubber gloves.

# **Lubrication Adapter**

An oil lubricant-only lubrication adapter is available for models NR/NRS.

Even if the LM Guide is installed in an orientation where oil lubrication is difficult, such as wall mount and inversed mount, the adapter is capable of feeding a constant quantity of lubricant to the four raceways.

### [Features]

The dedicated lubrication adapter for models NR-NRS is built in with a constant quantity distributor. Therefore, the adapter can accurately feed a constant quantity of lubricant to each raceway regardless of the mounting orientation. The adapter is economical since it is capable of constantly feeding the optimum amount of lubricant and helping eliminate the supply of surplus lubricant.

To provide pipe arrangement, simply connect an intermittent lubrication pump widely used for ordinary machine tools to the greasing holes (M8) on the front and the side of the lubrication adapter.

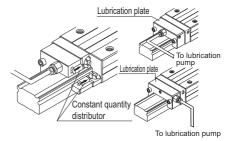

Fig.1 Structural Drawing

Removing/mounting Jig

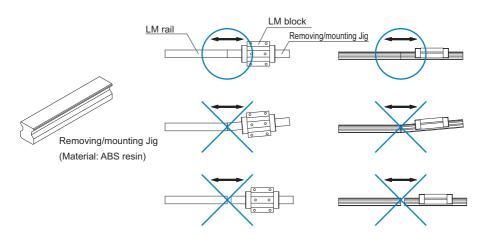

# Removing/mounting Jig

When assembling the guide, do not remove the LM block from the LM rail whenever possible. If it is inevitable to remove the LM block due to the plate cover type or the assembly procedure, be sure to use the removing/mounting jig.

Mounting the LM block without using the removing/mounting jig may cause rolling elements to fall from the LM block due to contamination by foreign material, damage to internal components or slight inclination. Mounting the LM block with some of the rolling elements missing may also cause damage to the LM block at an early stage.

When using the removing/mounting jig, do not incline the jig and match the ends of both LM rails. The removing/mounting jig may not be available, depending on model. If this is the case, use a spare LM rail. Contact THK for details.

If any of the rolling elements falls from the LM block, contact THK instead of using the product. Note that the removing/mounting jig is not included in the LM Guide package as standard. When desiring to use it, contact THK.

Unit: mm

3.2

# **End Piece EP**

For those models whose balls may fall if the LM rail is pulled out of the LM block, an end piece is attached to the product to prevent the LM block from being removed from the LM rail.

For models that can use the end piece, see the table below.

If removing the end piece when using the LM Guide, be sure that the LM block will not overshoot. The end piece can also be used as a fixing jig for a steel tape, and is available also for the LM rail of models SSR, SR and HSR.

Table 1 Dimension Table for End Piece EP for Models NR/NRS

Model No. LM Guide

### **Model Number Coding**

Model number configurations differ depending on the model features. Refer to the corresponding sample model number configuration.

### [LM Guide]

 Models SHS, SSR, SVR/SVS, SHW, HSR, SR, NR/NRS, HRW, JR, NSR-TBC, HSR-M1, SR-M1 and HSR-M2.

#### SHS25 KKHH +1200L Model No. Type of With QZ Contamination protection LM rail length Symbol for LM Symbol for No. of LM block Lubricator accessory symbol (\*1) rail jointed use (in mm) rails used on With steel the same plane (\*4) No. of LM blocks Radial clearance symbol (\*2) tape used on the same rail Normal (No symbol) Accuracy symbol (\*3) Light preload (C1) Normal grade (No Symbol)/High accuracy grade (H)/Precision grade (P) Medium preload (C0) Super precision grade (SP)/Ultra precision grade (UP)

(\*1) See contamination protection accessory on M1-510. (\*2) See M1-70. (\*3) See M1-76. (\*4) See M1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

### [Caged Roller LM Guide]

Models SRG, SRN and SRW

#### SRG45 KKHH C<sub>0</sub> +1200L With QZ Model Type of Contamination LM rail length Symbol for No. of protection rails used on the (in mm) number LM block Lubricator same plane (\*4) accessory symbol (\*1) Symbol for LM No. of LM blocks Radial clearance symbol (\*2) rail jointed use used on the same rail Normal (No symbol) Accuracy symbol (\*3) Precision grade (P)/Super precision grade (SP) Light preload (C1) Medium preload (C0) Ultra precision grade (UP)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-70. (\*3) See A1-76. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

### [Miniature Type LM Guide]

Models SRS, RSR, RSR-Z, and RSR-M1

#### +220L M Contamination Model No. With QZ LM rail length Stainless Symbol for No. of Lubricator protection accessory steel (in mm) rails used on symbol (\*1) LM rail the same plane (\*4) No. of LM blocks Radial clearance symbol (\*2) Accuracy symbol (\*3) used on the same rail Normal (No symbol)/Light preload (C1) Normal grade (No Symbol)/High accuracy grade (H)/Precision grade (P) (\*1) See contamination protection accessory on A1-510. (\*2) See A1-70. (\*3) See A1-76. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

### [Cross LM Guide]

Models SCR, CSR and MX

# 4 SCR25 QZ KKHH C0 +1200/1000L P

Model No. Contamination protection accessory symbol (\*1)

LM rail length on the X axis (in mm) LM rail length on the Y axis (in mm)

Total No. of LM blocks With QZ Lubricator Radial clearance symbol (\*2) Normal (No symbol)/Light preload (C1) Medium preload (C0) Accuracy symbol (\*3)
Precision grade (P)/Super precision grade (SP)
Ultra precision grade (UP)

(\*1) See contamination protection accessory on \$\textstyle{\textstyle{1}}\$-510. (\*2) See \$\textstyle{\textstyle{1}}\$-70. (\*3) See \$\textstyle{\textstyle{1}}\$-76.

### [Separate LM Guides]

Model HR

# 2 HR2555 UU M +1000L P T M

Model No. Contamination protection accessory symbol (\*1)

LM rail length (in mm) Symbol for LM rail jointed use

No. of LM blocks used on the same rail

Stainless steel LM block Accuracy symbol (\*2)

Normal grade (No Symbol)/High accuracy grade (H)/Precision grade (P) Super precision grade (SP)/Ultra precision grade (UP)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-76.

Note) One set of model HR means a combination of two LM rails and an LM blocks used on the same plane.

#### Model GSR

LM block

GSR25 T UU

Model number Contamination protection accessory symbol (\*1)

Type of LM block

LM rail

Model

number

GSR25 -1060L H

(in mm)

Symbol for tapped-hole LM rail type

Accuracy symbol (\*2) Normal grade (No Symbol) High accuracy grade (H) Precision grade (P)

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-76.

· Combination of LM rail and LM block

## GSR25 T 2 UU +1060L H T K

Model No. Type of LM block

Contamination protection accessory symbol (\*1) LM rail length (in mm)

Symbol Symbol for for LM rail tapped-hole

for LM rail tapped-hole LM rail type jointed use

No. of LM blocks used on the same rail

Accuracy symbol (\*2)

Normal grade (No Symbol)/High accuracy grade (H)/Precision grade (P)

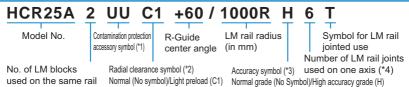

(\*1) See contamination protection accessory on **△1-510**. (\*2) See **△1-76**.

Note) One set of model GSR: This model number indicates that a single-rail unit constitutes one set.

#### Model No.

### [R Guide]

### Model HCR

(\*1) See A1-510 (contamination protection accessories). (\*2) See A1-70. (\*3) See A1-76. (\*4) Number of LM rails used on one arc. For details, contact THK.

### [Straight-Curved Guide]

### Model HMG

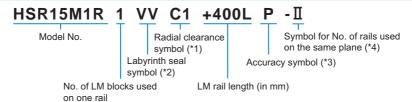

When 2 rails are used HMG15A 2 UU C1 +1000L T + 60/150R 6T + 60/300R 6T - II Contamination Overall linear LM rail | Center angle of one | No. of inner curved | Radius of outer Model No. Symbol for No. of protection rails used on the accessory symbol (\*1) length per rail inner curved rail LM rails jointed curved rail same plane (\*2) No. of LM blocks used Radial clearance symbol Symbol for linear Radius of inner Center angle of one No. of outer curved on the same rail Normal (No symbol)/Light preload (C1) LM rail joint curved rail outer curved rail LM rails jointed (\*1) See contamination protection accessory on A1-510. (\*2) See A1-13.

Note) This model number denotes one set consists of an LM block and LM rail. (i.e. If you are using 2 shafts, the required number of sets is 2.)

Model HMG does not have a seal as standard.

### [LM Guide for Medium-to-Low Vacuum]

### Model HSR-M1VV

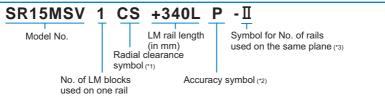

(\*1) See A1-70 (\*2) See A1-397 (\*3) See A1-76 (\*4) See A1-13.

Note1) The radial clearance, maximum LM rail length and accuracy class are equal to that of model HSR. Note2) With this model, a single-rail unit constitutes one set (i.e., the required number of sets when 2 rails are used in parallel is 2).

### [Oil-Free LM Guide for Special Environments]

### Model SR-MS

(\*1) See A1-70. (\*2) See A1-76. (\*3) See A1-13.

Note) With this model, a single-rail unit constitutes one set (i.e., the required number of sets when 2 rails are used in parallel is 2)

## **Notes on Ordering**

### [Order units]

Note that the number of items that constitute one set differs depending on the type of LM guide. Check the sample model number configurations and the accompanying notes.

### Sample LM guide orders

SHS25C2SSC1+640L 1 set

SHS25C2SSC1+640L-II 2 sets

### Sample model HR orders

HR2555UU+600L 1 set

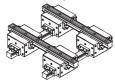

### Sample model GSR and GSR-R orders

GSR25T2UU+1060L 2 sets

#### Model No.

#### Sample cross LM guide orders (SCR, CSR and MX)

4SCR25UU+1200/1000LP 1 set

### Sample model HMG orders

HMG15A 2 UU C1 +1000L T + 60/150R 6T + 60/300R 6T - II 2 sets

Note) When ordering model HMG, attach a reference diagram clearly showing the positioning of the LM block and LM rail.

#### [Mounted orientation and lubrication method]

When placing an order, be sure to let THK know the mounting orientation and the exact position in each LM block where the grease nipple or the piping joint should be attached.

For the mounting orientation and the lubrication, see **A1-12** and **A24-2**, respectively.

#### [Supported options]

The supported options differ depending on the model number. Check the available options when ordering.

See A1-474.

#### [Maximum manufactured lengths for LM rails]

Where a high degree of precision is required, limits apply to the maximum manufactured lengths for LM rails. In such situations, contact THK .

# **Precautions on Using the LM Guide**

### [Handling]

- (1) This product consists mostly of heavy items (20 kg or more). When moving heavy items, use 2 or more people or moving equipment. Failure to do so could cause injury or product damage.
- (2) Do not disassemble the parts. This will cause dust to enter the product resulting in loss of functionality.
- (3) Tilting an LM block or LM rail may cause them to fall by their own weight.
- (4) Take care not to drop or strike the LM guide. This could cause injury or product damage. Giving an impact to it could also cause damage to its function even if the product looks intact.
- (5) Prevent foreign material, such as dust or cutting chips, from entering the system. This could cause damage to ball circulation components and loss of functionality.
- (6) When planning to use the LM system in an environment where the coolant penetrates the LM block, it may cause trouble to product functions depending on the type of the coolant. Contact THK for details.
- (7) Do not use the product at temperature of 80°C or higher. Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (8) If foreign material such as dust or cutting chips adheres to the product, replenish the lubricant after cleaning the product with pure white kerosene. For available types of detergent, contact THK.
- (9) If an LM guide will be in an inverted orientation, take preventive measures such as adding a safety mechanism to prevent falls. If the end plate is damaged due to an accident, etc., balls may fall out of the guide or the LM block become detached from the LM rail and fall down.
- (10)When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.
- (11)When removing the LM block from the LM rail and then replacing the block, an LM block mounting/removing jig that facilitates such installation is available. Contact THK for details.

#### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.
- (5) When adopting oil lubrication, the lubricant may not be distributed throughout the LM system depending on the mounting orientation of the system. Contact THK for details.
- (6) Although lubrication should be performed approximately every 100 km in travel distance, the lubrication interval may vary substantially according to conditions and the service environment. Contact THK for details.
- (7) If the mounting orientation is other than horizontal installation, the lubricant may not reach the raceway completely.
  - For the mounting orientation and the lubrication, see **A1-12** and **A24-2**, respectively.

#### [Storage]

When storing the LM Guide, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding high temperature, low temperature and high humidity.

#### Precautions on Use

Precautions on Handling the LM Guide for Special Environment

# Precautions on Handling the LM Guide for Special Environment

#### [Handling]

For the handling of LM Guides for special environment such as the LM Guide for Medium-to-Low Vacuum and the Oil-Free LM Guide, see the features of the respective model (LM Guide for Medium-to-Low Vacuum: A1-396 onward; Oil-Free LM Guide: A1-404 onward).

# **Precautions on Using Options for the LM Guide**

#### QZ Lubricator for the LM Guide

#### [Precaution on Selection]

Secure a stroke longer than the overall LM block with QZ Lubricator attached.

#### [Handling]

Take care not to drop or strike this product. This could cause injury or product damage.

Do not block the vent hole with grease or the like.

QZ is a lubricating device designed to feed a minimum amount of oil to the raceway, and does not provide an anti-rust effect to the whole LM Guide. When using it in an environment subject to a coolant or the like, we strongly recommend applying grease to the mounting base of the LM Guide and to the rail ends as an anti-rust measure.

#### [Service environment]

Be sure the service temperature of this product is between -10 to +50°C, and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked. When using it out of the service temperature range, contact THK in advance.

When desiring to use the product in a special environment, contact THK.

# Laminated Contact Scraper LaCS, Side Scraper for LM Guides

#### [Handling]

The lubricant impregnated into the scraper is used to increase its sliding capability. For lubrication of the LM Guide, attach QZ Lubricator, or the grease nipple on the side face of the end plate of the LM block, before providing a lubricant.

When using the product, be sure to attach the rail cap C or the plate cover.

#### [Service environment]

Be sure the service temperature of this product is between -20 to +80°C, and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked.

#### [Notes on the Product Functions]

It is specifically designed to provide dust prevention capability to remove foreign material and liquid. To seal oil, an end seal is required.

# **Light Contact Seal LiCS for LM Guides**

#### [Handling]

The lubricant impregnated into LiCS is used to increase its sliding capability. For lubrication of the LM Guide, attach the grease nipple on the end plate of the LM block before providing a lubricant.

#### [Service environment]

Be sure the service temperature of this product is between -20 to +80°C, and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked. It contacts only with the LM rail raceway. Do not use it in harsh environments.

### Cap GC

#### [Handling]

If GC caps are specified for the product, the edges of the LM rail mounting hole openings will be sharp. Take great care not to injure your fingers or hands while working.

When fitting GC caps, use a flat aligning tool to gradually punch the cap into the hole until it is level with the upper surface of the LM rail. Then run an oil stone over the rail until the upper surface of the rail and the GC caps are completely flat.

# **Features of the LM Guide**

# **Functions Required for Linear Guide Surface**

Large permissible load
Highly rigid in all directions
High positioning repeatability
Running accuracy can be obtained easily
High accuracy can be maintained over a long period

Smooth motion with no clearance
Superbly high speed
Easy maintenance
Can be used in various environments

### Features of the LM Guide

Large permissible load and high rigidity

Accuracy averaging effect by absorbing mounting surface error

Ideal four raceway, circular-arc groove, two point contact structure

Superb error-absorbing capability with the DF design

Low friction coefficient

Wide array of options (QZ lubricator, Laminated contact scraper LaCS, etc.)

As a result, the following features are achieved.

Easy maintenance
Improved productivity of the machine
Substantial energy savings
Low total cost
Higher accuracy of the machine
Higher efficiency in machine design

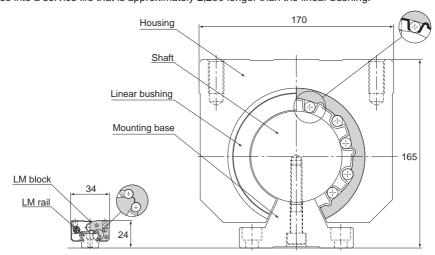

Features of the LM Guide

# **Large Permissible Load and High Rigidity**

#### [Large Permissible Load]

The LM Guide has raceway grooves with a radius almost equal to the ball radius, which is significantly different from the linear bushing. As shown in Fig.1, which compares size between the LM Guide and the linear bushing with similar basic dynamic load ratings, the LM Guide is much smaller than the linear bushing, indicating that the LM Guide allows a significantly compact design.

The reason for this space saving is the greater difference in permissible load between the R-groove contact structure and the surface contact structure. The R-groove contact structure (radius: 52% of the ball radius) can bear a load per ball 13 times greater than the surface contact structure. Since service life is proportional to the cube of the permissible load, this increased ball-bearing load translates into a service life that is approximately 2,200 longer than the linear bushing.

LM Guide model SSR15XW
Basic dynamic load rating: 14.7 kN

Linear Bushing model LM80 OP Basic dynamic load rating: 7.35 kN

Fig.1 Comparison between the LM Guide and the Linear Bushing

Table1 Load Capacity per Ball (P and P<sub>1</sub>)

| φ | 7.938 (5/16′′)   | 5.64 kN      | 0.44 kN                        | 13   |  |  |  |
| φ | 11.906 (15/32´´) | 12.68 kN     | 0.98 kN                        | 13   |  |  |  |

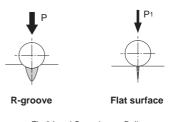

Fig.2 Load Capacity per Ball

#### [High Rigidity]

The LM Guide is capable of bearing vertical and horizontal loads. Additionally, due to the circular-arc groove design, it is capable of carrying a preload as necessary to increase its rigidity.

When compared with a feed screw shaft system and a spindle in rigidity, the guide surface using an LM Guide has higher rigidity.

# Example of comparing static rigidity between the LM Guide, a feed screw shaft system and a spindle

(vertical machining center with the main shaft motor of 7.5 kW)

[Components]

LM Guide: SVR45LC/C0

(C0 clearance: preload = 11.11kN)

Ball Screw: BNFN4010-5/G0

(G0 clearance: preload = 2.64kN)

Spindle: general-purpose cutting spindle

Table2 Comparison of Static Rigidity

Unit: N/µm

| Components | omponents X-axis direction direction |      | Z-axis direction                       |
|------------|--------------------------------------|------|----------------------------------------|
| LM Guide   | _                                    | 2400 | 9400 (radial)<br>7400 (reverse radial) |
| Ball screw | 330                                  | _    | _                                      |
| Spindle    | 250                                  | 250  | 280                                    |

Note) The rigidity of the feed screw shaft system includes rigidity of the shaft end support bearing.

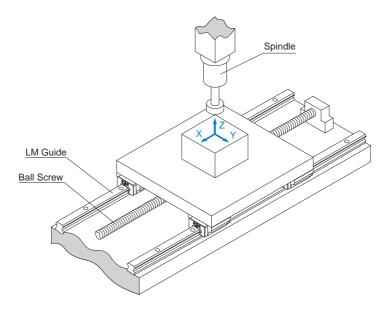

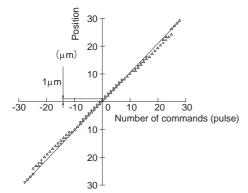

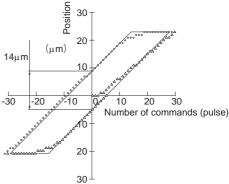

Fig.3

# **High Precision of Motion**

#### [Small lost motion]

The LM Guide is provided with an ideal rolling mechanism. Therefore, the difference between dynamic and static friction is minimal and lost motion hardly occurs.

LM Guide model HSR45

Square slide + Turcite

### [High running accuracy]

Use of the LM Guide allows you to achieve high running accuracy.

### [Measurement method]

### Pitching accuracy

### Yawing accuracy

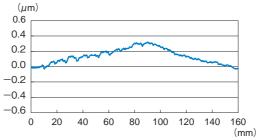

Fig.5 Dynamic Accuracy of a Single-axis Table

Features of the LM Guide

#### [High accuracy maintained over a long period]

As the LM Guide employs an ideal rolling mechanism, wear is negligible and high precision is maintained for long periods of time. As shown in Fig.6, when the LM Guide operates under both a preload and a normal load, more than 90% of the preload remains even after running 2,000 km.

# **Accuracy Averaging Effect by Absorbing Mounting Surface Error**

The LM Guide contains highly spherical balls and has a constrained structure with no clearance. In addition, it uses LM rails in parallel on multiple axes to form a guide system with multiple-axis configuration. Thus, the LM Guide is capable of absorbing misalignment in straightness, flatness or parallelism that would occur in the machining of the base to which the LM Guide is to be mounted or in the installation of the LM Guide by averaging these errors.

The magnitude of the averaging effect varies according to the length or size of the misalignment, the preload applied on the LM Guide and the number of axes in the multiple-axis configuration. When misalignment is given to one of the LM rails of the table as shown in Fig.8, the magnitude of misalignment and the actual dynamic accuracy of the table (straightness in the horizontal direction) are as shown in Fig.9.

By applying such characteristics obtained with the averaging effect, you can easily establish a guide system with high precision of motion.

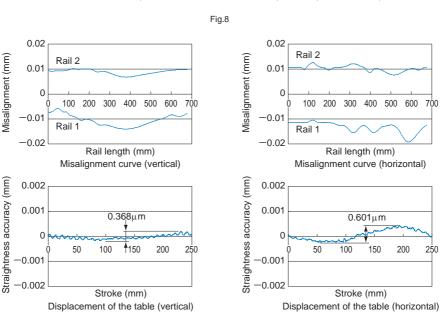

Fig.9

Features of the LM Guide

Even on a roughly milled mounting surface, the LM Guide drastically increases running accuracy of the top face of the table.

1/6

1/7

#### [Example of Installation]

When comparing the mounting surface accuracy (a) and the table running accuracy (b), the results are:

Vertical  $92.5\mu \text{m} \rightarrow 15\mu \text{m} = \text{Horizontal}$   $28\mu \text{m} \rightarrow 4\mu \text{m} = \text{m}$ 

Table4 Actual Measurement of Mounting-Surface Accuracy Unit:  $\mu m$ 

|           |                  |   |              | •              |

# **Easy Maintenance**

Unlike with sliding guides, the LM Guide does not incur abnormal wear. As a result, sliding surfaces do not need to be reconditioned, and precision needs not be altered. Regarding lubrication, sliding guides require forced circulation of a large amount of lubricant so as to maintain an oil film on the sliding surfaces, whereas the LM Guide only needs periodical replenishing of a small amount of grease or lubricant. Maintenance is that simple. This also helps keep the work environment clean.

Features of the LM Guide

# Substantial Energy Savings

As shown in Table6, the LM Guide has a substantial energy saving effect.

Table6 Comparative Data on Sliding and Rolling Characteristics

| Machine Specifications          |                                                      |                                                                        |  |

#### **Low Total Cost**

Compared with a sliding guide, the LM Guide is easier to assemble and does not require highly skilled technicians to perform the adjustment work. Thus, the assembly man-hours for the LM Guide are reduced, and machines and systems incorporating the LM Guide can be produced at lower cost. The figure below shows an example of difference in the procedure of assembling a machining center between using siding guides and using LM Guides.

Normally, with a sliding guide, the surface on which the guide is installed must be given a very smooth finish by grinding. However, the LM Guide can offer high precision even if the surface is milled or planed. Using the LM Guide thus cuts down on machining man-hours and lowers machining costs as a whole.

### [Assembly Procedure for a Machining Center]

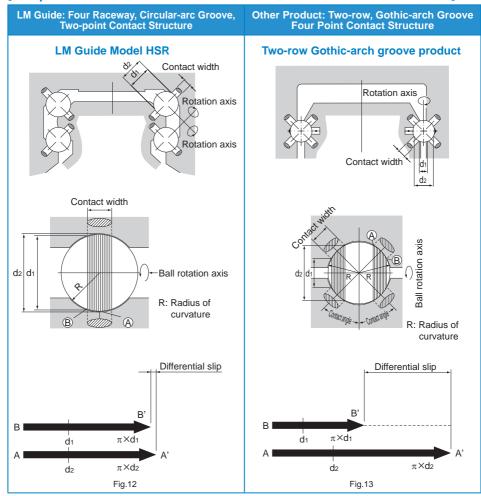

When extremely high precision is not required (e.g., running accuracy), the LM Guide can be attached to the steel plate even if the black scale on it is not removed.

Features of the LM Guide

# Ideal Four Raceway, Circular-Arc Groove, Two-Point Contact Structure

The LM Guide has a self-adjusting capability that competitors' products do not have. This feature is achieved with an ideal four raceway, circular-arc groove, two-point contact structure.

#### [Comparison of Characteristics between the LM Guide and Similar Products]

As indicated in Fig.12 and Fig.13, when the ball rotates one revolution, the ball slips by the difference between the circumference of the diameter of inner surface ( $\pi d_1$ ) and that of the outer contact diameter ( $\pi d_2$ ). (This slip is called differential slip.) If the difference is large, the ball rotates while slipping, the friction coefficient increases more than 10 times and the friction resistance steeply increases.

#### Four Raceway, Circular-Arc Groove, <u>Two-Point Contact</u> Structure

# Two-Row, Gothic-Arch Groove, Four Point Contact Structure

#### Smooth Motion

Since the ball contacts the groove at two points in the load direction as shown in Fig.12 and Fig.13 on 1-19 even under a preload or a normal load, the difference between d<sub>1</sub> and d<sub>2</sub> is small and the differential slip is minimized to allow smooth rolling motion.

The difference between  $d_1$  and  $d_2$  in the contact area is large as shown in Fig.12 and Fig.13 on **B1-19**. Therefore, if any of the following occurs, the ball will generate differential slip, causing friction almost as large as sliding resistance and shortening the service as a result of abnormal friction.

- (1) A preload is applied.
- (2) A lateral load is applied.
- (3) The mounting parallelism between the two axes is poor.

#### **Accuracy and Rigidity of the Mounting Surface**

In the ideal two-point contact structure, four rows of circular arc grooves are given appropriate contact angles. With this structure, a light distortion of the mounting surface would be absorbed within the LM block due to elastic deformation of the balls and moving of the contact points to allow unforced, smooth motion. This eliminates the need for a robust mounting base with high rigidity and accuracy for machinery such as a conveyance system.

With the Gothic-arch groove product, each ball contacts the groove at four points, preventing itself from being elastically deformed and the contact points from moving (i.e., no self-adjusting capability). Therefore, even a slight distortion of the mounting surface or an accuracy error of the rail bed cannot be absorbed and smooth motion cannot be achieved. Accordingly, it is necessary to machine a highly rigid mounting base with high precision and mount a high precision rail.

#### Rigidity

With the two-point contact, even if a relatively large preload is applied, the rolling resistance does not abnormally increase and high rigidity is obtained.

Since differential slip occurs due to the four-point contact, a sufficient preload cannot be applied and high rigidity cannot be obtained.

#### Load Rating

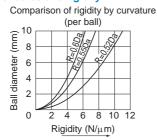

Since the curvature radius of the ball raceway is 51 to 52% of the ball diameter, a large rated load can be obtained.

Since the curvature radius of the gothic arch groove has to be 55 to 60% of the ball diameter, the rated load is reduced to approx. 50% of that of the circular arc groove.

#### Difference in Rigidity

As shown in Fig.14, the rigidity widely varies according to the difference in curvature radius or difference in preload.

#### Curvature radius and rigidity

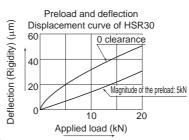

Fig.14

#### Difference in Service Life

Since the load rating of the gothic arch groove is reduced to approx. 50% of that of the circular arc groove, the service life also decreases to 87.5%.

Features of the LM Guide

### [Accuracy Error of the Mounting Surface and Test Data on Rolling Resistance]

The difference between the contact structures translates into a rolling resistance.

In the gothic arch groove contact structure, each ball contacts at four points and differential slip or spinning occurs if a preload is applied to increase rigidity or an error in the mounting precision is large. This sharply increases the rolling resistance and causes abnormal wear in an early stage.

The following are test data obtained by comparing an LM Guide having the four raceway, circular-arc groove two-point contact structure and a product having the two-row, Gothic-arch, four-point contact structure.

#### [Sample]

#### (1) LM Guide 2 sets SR30W (radial type) HSR35A (4-way equal-load type) 2 sets (2) Two-row Gothic-arch groove product

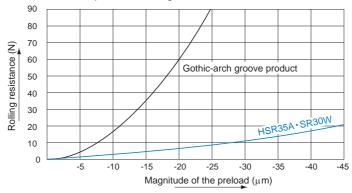

Type with dimensions similar to HSR30 2 sets

### [Conditions]

Radial clearance: ±0µm Without seal Without Iubrication Load: table mass of 30 kg

#### Data 1: Preload and rolling resistance

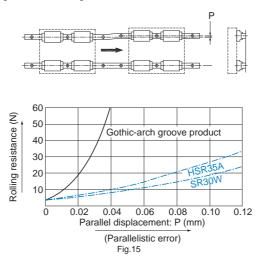

When a preload is applied, the rolling resistance of the Gothic-arch groove product steeply increases and differential slip occurs. Even under a preload, the rolling resistance of the LM Guide does not increase.

#### Data 2: Error in parallelism between two axes and rolling resistance

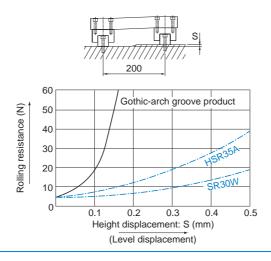

As shown in the Fig.15, part of the rails mounted in parallel is parallelly displaced and the rolling resistance at that point is measured.

With the Gothic-arch groove product, the rolling resistance is 34 N when the parallelistic error is 0.03 mm and 62 N when the error is 0.04 mm. These resistances are equivalent to the slip friction coefficients, indicating that the balls are in sliding contact with the groove.

#### Data 3: Difference between the levels of the right and left rails and rolling resistance

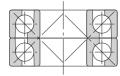

The bottom of either rail is displaced by distance S so that there is a level difference between the two axes, and then rolling resistance is measured. If there is a level difference between the right and left rails, a moment acts on the LM block, and in the case of the Gothic-arch groove, spinning occurs. Even if the level difference between the two rails is as great as 0.3/200 mm, the LM Guide absorbs the error. This indicates that the LM Guide can operate normally even when such errors are present.

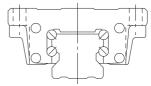

Features of the LM Guide

# **Superb Error-Absorbing Capability with the DF Design**

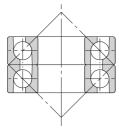

Since the LM Guide has a contact structure similar to the front-to-front mount of angular ball bearings, it has superb self-adjusting capability.

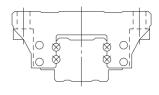

Angular Ball Bearings Mounted Front-to-front (DF type)

DF Type Four-row Angular Contact (LM Guide)

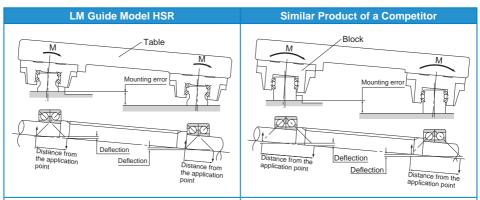

Angular Ball Bearings Mounted Back-to-back (DB type)

Four-row Gothic-arch Contact

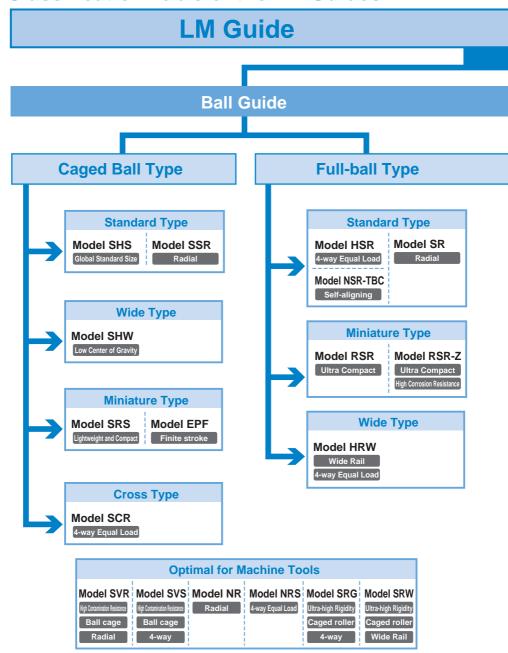

An LM ball guide mounted on a plane receives a moment (M) due to an error in flatness or in level or a deflection of the table. Therefore, it is essential for the guide to have self-adjusting capability.

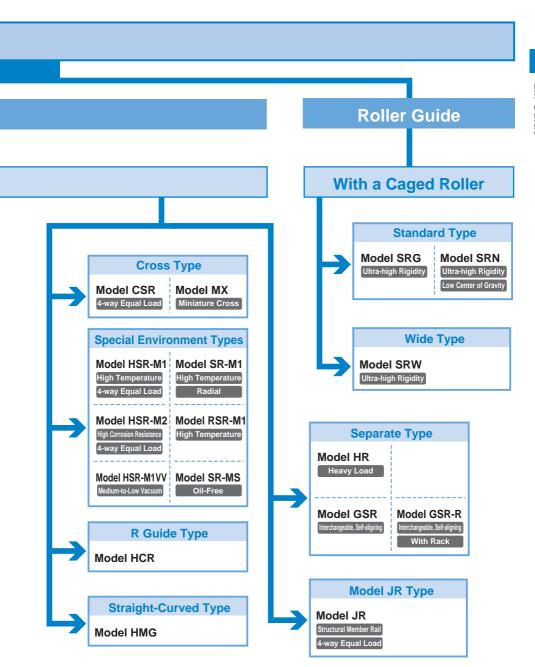

Since the distance from the application point of the bearing is small, the internal load generated from a mounting error is small and the self-adjusting capability is large.

Since the distance from the application point of the bearing is large, the internal load generated from a mounting error is large and the self-adjusting capability is small. With an LM ball guide having angular ball bearings mounted back-to-back, if there is an error in flatness or a deflection in the table, the internal load applied to the block is approx. 6 times greater than that of the front-to-front mount structure and the service life is much shorter. In addition, the fluctuation in sliding resistance is greater.

# Classification Table of the LM Guides

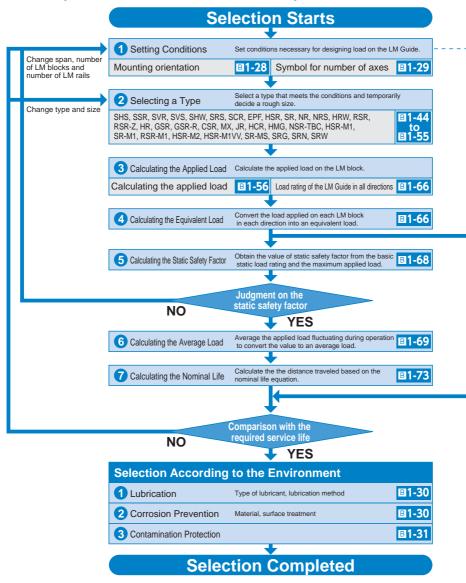

Classification Table of the LM Guides

# Flowchart for Selecting an LM Guide

[Steps for Selecting an LM Guide]

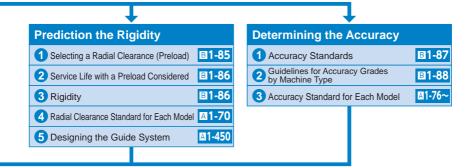

The following flowchart can be used as reference for selecting an LM Guide.

#### Point of Selection

#### Flowchart for Selecting an LM Guide

- · Space in the guide section
- Dimensions (span, number of LM blocks, number of LM rails, thrust)
- · Installation direction (horizontal, vertical, slant mount, wall mount, suspended)
- · Magnitude, direction and position of the working load
- · Operating frequency (duty cycle)
- · Speed (acceleration)
- · Stroke length
- · Required service life
- · Precision of motion
- Environment
- In a special environment (vacuum, clean room, high temperature, environment exposed to contaminated environment, etc.), it is necessary to take into account material, surface treatment, lubrication and contamination protection.

# **Setting Conditions**

## Conditions of the LM Guide

#### [Mounting Orientation]

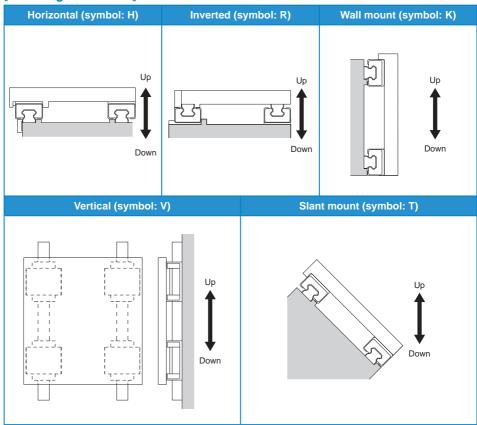

The LM Guide can be mounted in the following five orientations.

If the mounting orientation is other than horizontal use, the lubricant may not reach the raceway completely.

Be sure to let THK know the installation direction and the exact position in each LM block where the grease nipple or the piping joint should be attached.

For the lubrication, see **A24-2**.

### [Mounting Orientation]

#### Point of Selection

**Setting Conditions** 

#### [Symbol for Number of Axes]

If two or more units of the LM Guide are parallelly used in combination on the same plane, specify the number of the LM rails (symbol for number of axes) used in combination in advance. (For accuracy standards and radial clearance standards, see **A1-76** and **A1-70**,

respectively.)

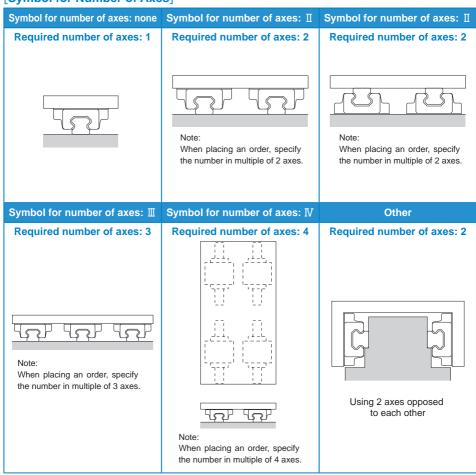

#### Model number coding

# SHS25C2SSCO+1000LP - II

Model number (details are given on the corresponding page of the model)

Symbol for number of axes ("II" indicates 2 axes. No symbol for a single axis)

#### [Symbol for Number of Axes]

#### [Service environment]

#### Lubrication

When using an LM system, it is necessary to provide effective lubrication. Without lubrication, the rolling elements or the raceway may be worn faster and the service life may be shortened.

A lubricant has effects such as the following.

- (1) Minimizes friction in moving elements to prevent seizure and reduce wear.
- (2) Forms an oil film on the raceway to decrease stress acting on the surface and extend rolling fatique life.
- (3) Covers the metal surface to prevent rust formation.

To fully bring out the LM Guide's functions, it is necessary to provide lubrication according to the conditions.

If the mounting orientation is other than horizontal use, the lubricant may not reach the raceway completely.

Be sure to let THK know the mounting orientation and the exact position in each LM block where the grease nipple or the piping joint should be attached. For the mounting orientation and the lubrication, see **11-28** and **24-2**, respectively.

Even with an LM Guide with seals, the internal lubricant gradually seeps out during operation. Therefore, the system needs to be lubricated at an appropriate interval according to the conditions.

#### Corrosion Prevention

#### **■**Determining a Material

Any LM system requires a material that meets the environments. For use in environments where corrosion resistance is required, some LM system models can use martensite stainless steel.

(Martensite stainless steel can be used for LM Guide models SSR, SHW, SRS, HSR, SR, HRW, RSR, RSR-Z and HR.)

The HSR series includes HSR-M2, a highly corrosion resistant LM Guide using austenite stainless steel, which has high anti-corrosive effect. For details, see **A1-390**.

#### **■**Surface Treatment

The surfaces of the rails and shafts of LM systems can be treated for anti-corrosive or aesthetic purposes.

THK offers THK-AP treatment, which is the optimum surface treatment for LM systems.

There are roughly three types of THK-AP treatment: AP-HC, AP-C and AP-CF. (See **0.20**.)

#### **Point of Selection**

**Setting Conditions** 

#### Contamination Protection

When foreign material enters an LM system, it will cause abnormal wear or shorten the service life, and it is necessary to prevent foreign material from entering the system. When entrance of foreign material is predicted, it is important to select an effective sealing device or dust-control device that meets the environment conditions.

THK offers contamination protection accessories for LM Guides by model number, such as end seals made of special synthetic rubber with high wear resistance, and side seals and inner seals for further increasing dust-prevention effect.

In addition, for locations with adverse environment, Laminated Contact Scraper LaCS and dedicated bellows are available by model number. Also, THK offers dedicated caps for LM rail mounting holes, designed to prevent cutting chips from entering the LM rail mounting holes.

When it is required to provide contamination protection for a Ball Screw in an environment exposed to cutting chips and moisture, we recommend using a telescopic cover that protects the whole system or a large bellows.

For the options, see **B1-103**.

#### [Special environments]

# Clean Room

In a clean environment generation of dust from the LM system has to be reduced and anti-rust oil cannot be used. Therefore, it is necessary to increase the corrosion resistance of the LM system. In addition, depending on the level of cleanliness, a dust collector is required.

### Dust Generation from the LM System

■ Measure to Prevent Dust Generation Resulting from Flying Grease

#### **THK AFE-CA and AFF Grease**

Use environmentally clean grease that produces little dust.

■ Measure to Reduce Dust Generation Resulting from Metallic Abrasion Dust

#### Caged Ball LM Guide

Use the Caged Ball LM Guide, which has no friction between balls and generates little metallic abrasion dust, to allow generation of dust to be minimized.

#### Corrosion Prevention

#### ■ Material-based Measure

#### Stainless Steel LM Guide

This LM Guide uses martensite stainless steel, which has corrosion resistant effect.

#### **Highly Corrosion Resistant LM Guide**

It uses austenite stainless steel, which has a high corrosion resistant effect, in its LM rail.

■ Measure Through Surface Treatment

#### THK AP-HC, AP-C and AP-CF Treatment

The LM system is surface treated to increase corrosion resistance.

**Setting Conditions** 

## Vacuum

In a vacuum environment, measures are required to prevent gas from being emitted from a resin and the scattering of grease. Anti-rust oil cannot be used, therefore, it is necessary to select a product with high corrosion resistance.

Measure to Prevent Emission of Gas from Resin Stainless Steel LM Guide

The endplate (ball circulation path normally made of resin) of the LM block is made of stainless steel to reduce emission of gas.

Measure to Prevent Grease from Evaporating

#### **Vacuum Grease**

If a general-purpose grease is used in a vacuum environment, oil contained in the grease evaporates and the grease looses lubricity. Therefore, use a vacuum grease that uses fluorine based oil, whose vapor pressure is low, as the base oil.

#### ■Corrosion Prevention

#### Stainless Steel LM Guide

In a vacuum environment, use a stainless steel LM Guide, which is highly corrosion resistant.

#### **High Temperature LM Guide**

If high temperature is predicted due to baking, use a High Temperature LM Guide, which is highly resistant to heat and corrosion.

■Highly Corrosion Resistant LM Guide

This LM Guide uses austenite stainless steel, which has a high anti-corrosion effect, in the LM rail.

# Oil-Free

In environments susceptible to liquid lubricants, a lubrication method other than grease or oil is required.

#### ■Dry Lubricant

#### **Dry Lubrication S-Compound Film**

Dry Lubrication S-Compound Film is a fully dry lubricant developed for use under atmospheric to high-vacuum environments. It has superior characteristics in load carrying capacity, wear resistance and sealability to other lubrication systems.

**Highly Corrosion Resistant LM Guide** 

**Surface Treatment** 

**Setting Conditions** 

# High Speed

In a high speed environment, it is necessary to apply an optimum lubrication method that reduces heat generation during high speed operation and increases grease retention.

#### ■ Measures to Reduce Heat Generation

#### Caged Ball LM Guide

Use of a ball cage eliminates friction between balls to reduce heat generation. In addition, grease retention is increased, thus to achieve long service life and high speed operation.

#### **THK AFA Grease, AFJ Grease**

It reduces heat generation in high speed operation and has superb lubricity.

#### ■ Measure to Improve Lubrication

#### **QZ** Lubricator

Continuous oil lubrication ensures that the lubrication and maintenance interval can significantly be extended. It also applies the right amount of oil to the raceway, making itself an eco-friendly lubrication system that does not contaminate the surrounding area.

Setting Conditions

# High Temperature

In a high temperature environment, dimensional alterations caused by heat is problematic. Use a High Temperature LM Guide, which is heat resistant and has minimal dimensional alterations after being heated. Also, use a high temperature grease.

#### ■ Heat Resistance

#### **High Temperature LM Guide**

A special heat treatment to maintain dimensional stability minimizes dimensional variations due to heating and cooling.

#### Grease

#### **High Temperature Grease**

Use a high temperature grease with which the rolling resistance of the LM system is consistent even at high temperature.

# Low Temperature

In a low temperature environment, use an LM system with a minimal amount of resin components and a grease that minimize fluctuations in rolling resistance, even at low temperature.

### Impact of Low Temperature on Resin Components

#### Stainless Steel LM Guide

The endplate (ball circulation path normally made of resin) of the LM block is made of stainless steel.

#### **■**Corrosion Prevention

Provide surface treatment to the LM system to increase its corrosion resistance.

#### Grease

Use THK AFC Grease, with which the rolling resistance of the system little is consistent even at low temperature.

# Micro Motion

Micro strokes cause the oil film to break, resulting in poor lubrication and early wear. In such cases, select a grease with which the oil film strength is high and an oil film can easily be formed.

#### Grease

#### **THK AFC Grease**

AFC Grease is a urea-based grease that excels in oil film strength and wear resistance.

**Setting Conditions** 

# Foreign Matter

If foreign matter enters the LM system, it will cause abnormal wear and shorten the service life. Therefore, it is necessary to prevent such entrance of foreign matter.

Especially in an environment containing small foreign matter or a water-soluble coolant that a telescopic cover or a bellows cannot remove, it is necessary to attach a contamination protection accessory capable of efficiently removing foreign matter.

#### ■Metal Scraper

It is used to remove relatively large foreign objects such as cutting chips, spatter and sand or hard foreign matter that adhere to the LM rail.

#### ■Laminated Contact Scraper LaCS

Unlike a metal scraper, it removes foreign matter while it is in contact with the LM rail. Therefore, it demonstrates a high contamination protection effect against small foreign matter, which has been difficult to remove with conventional metal scrapers.

#### ■QZ Lubricator

QZ Lubricator is a lubrication system that feeds the right amount of lubricant by closely contacting its highly oil-impregnated fiber net to the ball raceway.

Metal Cap Dedicated for LM Rail Mounting Holes GC Cap

GC cap is a metallic cap that plugs the LM rail mounting hole (article compliant with the RoHS Directives). It prevents the entrance of foreign material and coolant from the LM rail top face (mounting hole) under harsh environments, and significantly increases the dust control performance of the LM Guide if used with a dust control seal.

#### Protector

The protector minimizes the entrance of foreign material even in harsh environments where foreign material such as fine particles and liquids are present.

# **Selecting a Type**

# **Types of LM Guides**

THK offers a wide array of types and dimensions with LM Guides as standard so that you can select the optimal product for any application. With the unit structure of each model, you can easily obtain high running accuracy with no clearance simply by mounting the product on a plane surface with bolts. We have a proven track record and know-how in extensive applications with LM Guides.

# **Calculating the Applied Load**

The LM Guide is capable of receiving loads and moments in all directions that are generated due to the mounting orientation, alignment, gravity center position of a traveling object, thrust position and cutting resistance.

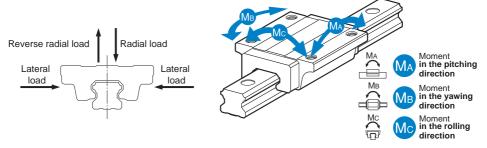

Fig.1 Directions of the Loads Applied on the LM Guide

## **Calculating an Applied Load**

#### [Single-Axis Use]

#### Moment Equivalence

When the installation space for the LM Guide is limited, you may have to use only one LM block, or double LM blocks closely contacting with each other. In such a setting, the load distribution is not uniform and, as a result, an excessive load is applied in localized areas (i.e., both ends) as shown in Fig.2. Continued use under such conditions may result in flaking in those areas, consequently shortening the service life. In such a case, calculate the actual load by multiplying the moment value by any one of the equivalent-moment factors specified in Table1 to Table7 **\bilde{\Bar}1-43**.

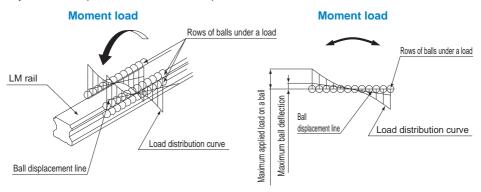

Fig.2 Ball Load when a Moment is Applied

An equivalent-load equation applicable when a moment acts on an LM Guide is shown below.

 $P = K \cdot M$ 

P : Equivalent load per LM Guide (N)

K : Equivalent moment factor

M : Applied moment (N-mm)

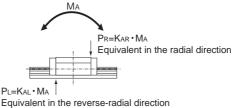

Calculating the Applied Load

#### Equivalent Factor

Since the rated load is equivalent to the permissible moment, the equivalent factor to be multiplied when equalizing the  $M_A$ ,  $M_B$  and  $M_C$  moments to the applied load per block is obtained by dividing the rated loads in the corresponding directions.

With those models other than 4-way equal load types, however, the load ratings in the 4 directions differ from each other. Therefore, the equivalent factor values for the  $M_A$  and  $M_C$  moments also differ depending on whether the direction is radial or reverse radial.

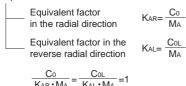

#### ■Equivalent Factors for the M<sub>A</sub> Moment

C<sub>0</sub>: Basic static load rating (radial direction) (N) C<sub>0L</sub>: Basic static load rating (reverse radial direction) (N) C<sub>0T</sub>: Basic static load rating (lateral direction) (N) P<sub>R</sub> : Calculated load (radial direction) (N) P<sub>L</sub> : Calculated load (reverse radial direction) (N) P<sub>T</sub> : Calculated load (lateral direction) (N)

Calculating the Applied Load

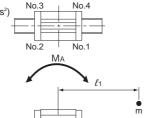

## **Example of calculation**

#### When one LM block is used

Model No.: SSR20XV1

Gravitational acceleration g=9.8 (m/s²)

Mass m=10 (kg)  $\ell_1$ =200 (mm)  $\ell_2$ =100 (mm)

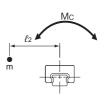

Fig.6 When One LM Block is Used

No.1  $P_1=mg+K_{AR1} \cdot mg \cdot \ell_1+K_{CR} \cdot mg \cdot \ell_2=98+0.275 \times 98 \times 200+0.129 \times 98 \times 100=6752$  (N)

No.2  $P_2=mg-K_{AL1} \cdot mg \cdot \ell_1 + K_{CR} \cdot mg \cdot \ell_2 = 98-0.137 \times 98 \times 200 + 0.129 \times 98 \times 100 = -1323$  (N)

No.3  $P_3=mg-K_{AL1}\bullet mg\bullet \ell_1-K_{CL}\bullet mg\bullet \ell_2=98-0.137\times 98\times 200-0.0644\times 98\times 100=-3218$  (N)

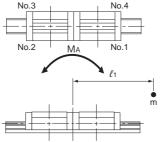

No.4  $P_4=mg+K_{AR1}\bullet mg\bullet\ell_1-K_{CL}\bullet mg\bullet\ell_2=98+0.275\times98\times200-0.0644\times98\times100=4857$  (N)

#### When two LM blocks are used in close contact with each other

Model No.: SVS25R2

Gravitational acceleration g=9.8 (m/s²)

Mass m=5 (kg)  $\ell_1$ =200 (mm)  $\ell_2$ =150 (mm)

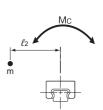

Fig.7 When Two LM Blocks are Used in Close Contact with Each Other

No.1 P<sub>1</sub>= 
$$\frac{mg}{2}$$
 +K<sub>AR2</sub>·mg· $\ell_1$ +K<sub>CR</sub>· $\frac{mg\cdot\ell_2}{2}$  =  $\frac{49}{2}$ +0.0188×49×200+0.0814× $\frac{49\times150}{2}$  =507.9 (N)

No.2 
$$P_2 = \frac{mg}{2} - K_{AL2} \cdot mg \cdot \ell_1 + K_{CR} \cdot \frac{mg \cdot \ell_2}{2} = \frac{49}{2} - 0.0158 \times 49 \times 200 + 0.0814 \times \frac{49 \times 150}{2} = 168.8 \text{ (N)}$$

$$No.3 \quad P_{3} = \frac{mg}{2} - K_{AL2} \cdot mg \cdot \ell_{1} - K_{CL} \cdot \quad \frac{mg \cdot \ell_{2}}{2} = \frac{49}{2} - 0.0158 \times 49 \times 200 - 0.0684 \times \frac{49 \times 150}{2} = -381.7 \text{ (N)}$$

No.4 P<sub>4</sub>= 
$$\frac{mg}{2}$$
 +K<sub>AR2</sub>\* $mg$ \* $\ell_1$ -K<sub>CL</sub>\*  $\frac{mg$ \* $\ell_2}{2}$  =  $\frac{49}{2}$  +0.0188×49×200-0.0684×  $\frac{49\times150}{2}$  =-42.6 (N)

Note1) Since an LM Guide used in vertical installation receives only a moment load, there is no need to apply a load force (mg).

#### [Double-axis Use]

#### Setting Conditions

Set the conditions needed to calculate the LM system's applied load and service life in hours.

The conditions consist of the following items.

- (1) Mass: m (kg)
- (2) Direction of the working load
- (3) Position of the working point (e.g., center of gravity):  $\ell_2$ ,  $\ell_3$ ,  $h_1$ (mm)
- (4) Thrust position:  $\ell_4$ ,  $h_2$ (mm)
- (5) LM system arrangement:  $\ell_0$ ,  $\ell_1$ (mm) (No. of units and axes)
- (6) Velocity diagram

Speed: V (mm/s) Time constant:  $t_n$  (s) Acceleration:  $\alpha_n$ (mm/s²)

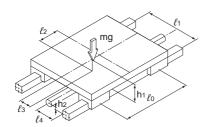

$$(\alpha_n = \frac{V}{t_n})$$

(7) Duty cycle

Number of reciprocations per minute: N<sub>1</sub>(min<sup>-1</sup>)

- (8) Stroke length:  $\ell_s(mm)$
- (9) Average speed: V<sub>m</sub>(m/s)
- (10) Required service life in hours: Lh(h)

Gravitational acceleration g=9.8 (m/s²)

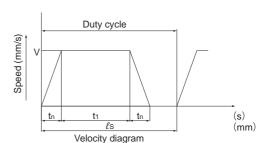

Fig.8 Condition

Calculating the Applied Load

#### Applied Load Equation

The load applied to the LM Guide varies with the external force, such as the position of the gravity center of an object, thrust position, inertia generated from acceleration/deceleration during start or stop, and cutting force.

In selecting an LM Guide, it is necessary to obtain the value of the applied load while taking into account these conditions.

Calculate the load applied to the LM Guide in each of the examples 1 to 10 shown below.

| m          | : Mass                                           | (kg)  |
|------------|--------------------------------------------------|-------|
| $\ell_{n}$ | : Distance                                       | (mm)  |
| $F_n$      | : External force                                 | (N)   |
| $P_n$      | : Applied load (radial/reverse radial direction) | (N)   |
| _          |                                                  | (1.1) |

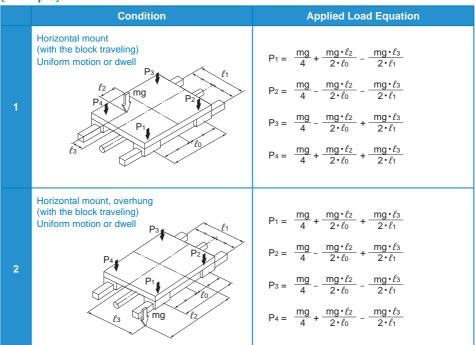

P<sub>nT</sub> : Applied load (lateral directions) (N) : Gravitational acceleration (m/s<sup>2</sup>)

 $(q = 9.8 \text{m/s}^2)$ V : Speed (m/s)t<sub>n</sub>: Time constant (s)

: Acceleration (m/s<sup>2</sup>)

$$(\alpha_n = \frac{V}{t_n})$$

### [Example]

#### Calculating the Applied Load

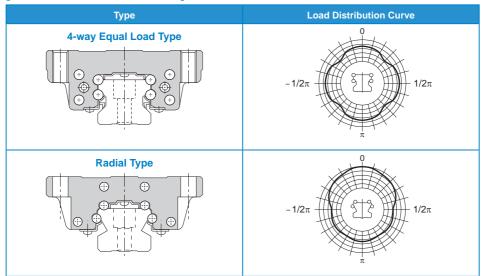

# **Calculating the Equivalent Load**

#### Rated Load of an LM Guide in Each Direction

The LM Guide is categorized into roughly two types: the 4-way equal load type, which has the same rated load in the radial, reverse radial and lateral directions, and the radial type, which has a large rated load in the radial direction. With the radial type LM Guide, the rated load in the radial direction is different from that in the reverse-radial and lateral directions. The basic load rating in the radial direction is indicated in the specification table. The values in the reverse-radial and lateral directions are obtained from Table8 on **A1-58**.

#### [Rated Loads in All Directions]

#### [Equivalent Load P<sub>E</sub>]

The LM Guide can bear loads and moments in all directions, including a radial load (PR), reverse radial load (PL) and lateral loads (PT), simultaneously.

When two or more loads (e.g., radial load and lateral load) are simultaneously applied to the LM Guide, the service life and the static safety factor are calculated using equivalent load values obtained by converting all the loads into radial load or reverse-radial load.

Calculating the Equivalent Load

#### [Equivalent Load Equation]

When the LM block of the LM Guide receives loads simultaneously in the radial and lateral directions, or the reverse radial and lateral directions, the equivalent load is obtained from the equation below.

#### $P_E = X \cdot P_{R(L)} + Y \cdot P_T$

P<sub>E</sub> : Equivalent load (N)

·Radial direction

·Reverse radial direction

PL: Reverse radial load (N)

 $P_{T}$ : Lateral load (N)

X,Y : Equivalent factor

(see Table9 on **A1-60**)

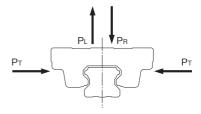

Fig.9 Equivalent of Load of the LM Guide

# Calculating the Static Safety Factor

To calculate a load applied to the LM Guide, the average load required for calculating the service life and the maximum load needed for calculating the static safety factor must be obtained first. In a system subject to frequent starts and stops, placed under cutting forces or under a large moment caused by an overhang load, an excessively large load may apply to the LM Guide. When selecting a model number, make sure that the desired model is capable of receiving the required maximum load (whether stationary or in motion). Table1 shows reference values for the static safety factor.

Table1 Reference Values for the Static Safety Factor (fs)

| Machine using the LM Guide   | Load conditions             | Lower limit of fs |
|------------------------------|-----------------------------|-------------------|
| General industrial machinery | Without vibration or impact | 1.0 to 3.5        |

Calculating the Average Load

# **Calculating the Average Load**

In cases where the load applied to each LM block fluctuates under different conditions, such as an industrial robot holding a work with its arm as it advances and receding with its arm empty, and a machine tool handling various workpieces, it is necessary to calculate the service life of the LM Block while taking into account such fluctuating loading conditions.

The average load (P<sub>m</sub>) is the load under which the service life of the LM Guide is equivalent to that under varying loads applied to the LM blocks.

$$P_{m} = \sqrt[i]{\frac{1}{L} \cdot \sum_{n=1}^{n} \left( P_{n}^{i} \cdot L_{n} \right)}$$

: Average Load (N)

: Varying load (N)

: Total travel distance (mm) : Distance traveled under load Pn

(mm)

: Constant determined by rolling element

Note) The above equation or the equation (1) below applies when the rolling elements are balls. (1) When the load fluctuates stepwise

(a) 
$$P_m = 0.65 P_{max} \cdots (4)$$

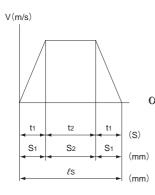

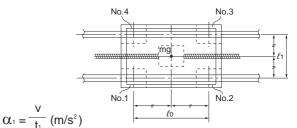

Calculating the Average Load

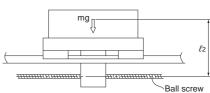

## **Example of Calculating the Average Load (1)**

## - with Horizontal Mount and Acceleration/Deceleration Considered -

#### [Conditions]

#### [Load Applied to the LM Block]

#### During uniform motion

$$P_1 = + \frac{mg}{4}$$

$$P_2 = + \frac{mg}{4}$$

$$P_3 = + \frac{mg}{4}$$

$$P_4 = + \frac{mg}{4}$$

## During acceleration

$$Pa_1 = P_1 + \frac{m \cdot \alpha_1 \cdot \ell_2}{2 \cdot \ell_0}$$

$$Pa_2 = P_2 - \frac{m \cdot \alpha_1 \cdot \ell_2}{2 \cdot \ell_0}$$

$$Pa_3 = P_3 - \frac{m \cdot \alpha_1 \cdot \ell_2}{2 \cdot \ell_0}$$

$$Pa_4 = P_4 + \frac{m \cdot \alpha_1 \cdot \ell_2}{2 \cdot \ell_0}$$

## During deceleration

$$Pd_1 = P_1 - \frac{m \cdot \alpha_1 \cdot \ell_2}{2 \cdot \ell_2}$$

$$Pd_2 = P_2 + \frac{m \cdot \alpha_1 \cdot \ell_2}{2 \cdot \ell_0}$$

$$Pd_3 = P_3 + \frac{m \cdot \alpha_1 \cdot \ell_2}{2 \cdot \ell_0}$$

$$Pd_4 = P_4 - \frac{m \cdot \alpha_1 \cdot \ell_2}{2 \cdot \ell_2}$$

## [Average load]

$$P_{m_1} = \sqrt[3]{\frac{1}{\ell_s} (Pa_1^3 \cdot s_1 + P_1^3 \cdot s_2 + Pd_1^3 \cdot s_3)}$$

$$P_{m_2} = \sqrt[3]{\frac{1}{\ell_s} (Pa_2^3 \cdot s_1 + P_2^3 \cdot s_2 + Pd_2^3 \cdot s_3)}$$

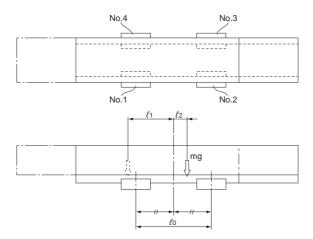

$$P_{m_3} = \sqrt[3]{\frac{1}{\ell_s} (Pa_3^3 \cdot s_1 + P_3^3 \cdot s_2 + Pd_3^3 \cdot s_3)}$$

$$P_{m4} = \sqrt[3]{\frac{1}{\ell_s} (Pa_4^3 \cdot s_1 + P_4^3 \cdot s_2 + Pd_4^3 \cdot s_3)}$$

Note) Pan and Pdn represent loads applied to each LM block. The suffix "n" indicates the block number in the diagram above.

## **Example of Calculating the Average Load (2) - When the Rails are Movable**

#### [Conditions]

#### [Load Applied to the LM Block]

#### At the left of the arm

$$P_{\ell_1} = + \frac{mg}{4} + \frac{mg \cdot \ell_1}{2 \cdot \ell_0}$$

$$P_{\ell_2} = + \frac{mg}{4} - \frac{mg \cdot \ell_1}{2 \cdot \ell_0}$$

$$P_{\ell_3} = + \frac{mg}{4} - \frac{mg \cdot \ell_1}{2 \cdot \ell_0}$$

$$P_{\ell_4} = + \frac{mg}{4} + \frac{mg \cdot \ell_1}{2 \cdot \ell_0}$$

## •At the right of the arm

$$P_{r_1} = + \frac{mg}{4} - \frac{mg \cdot \ell_2}{2 \cdot \ell_0}$$

$$P_{r_2} = + \frac{mg}{4} + \frac{mg \cdot \ell_2}{2 \cdot \ell_0}$$

$$P_{r_3} = + \frac{mg}{4} + \frac{mg \cdot \ell_2}{2 \cdot \ell_0}$$

$$P_{r_4} = + \frac{mg}{4} - \frac{mg \cdot \ell_2}{2 \cdot \ell_0}$$

#### [Average load]

$$P_{m_1} = \frac{1}{3} (2 \cdot |P_{\ell_1}| + |P_{r_1}|)$$

$$P_{m_2} = \frac{1}{3} (2 \cdot |P_{\ell_2}| + |P_{r_2}|)$$

$$P_{m_3} = \frac{1}{3} (2 \cdot |P_{\ell_3}| + |P_{r_3}|)$$

$$P_{m_4} = \frac{1}{3} (2 \cdot |P_{\ell_4}| + |P_{r_4}|)$$

Note) P<sub>m</sub> and P<sub>m</sub> represent loads applied to each LM block. The suffix "n" indicates the block number in the diagram above.

Calculating the Nominal Life

# **Calculating the Nominal Life**

The service life of an LM Guide is subject to variations even under the same operational conditions. Therefore, it is necessary to use the nominal life defined below as a reference value for obtaining the service life of the LM Guide. The nominal life means the total travel distance that 90% of a group of units of the same LM Guide model can achieve without flaking (scale-like pieces on the metal surface) after individually running under the same conditions.

## Nominal Life Equation for an LM Guide Using Balls

|   |   | / f+ • f • fc                 | C \ | 3<br><b>×</b> 50 |
|---|---|-------------------------------|-----|------------------|
| L | = | $\int \frac{1}{f_{\text{W}}}$ | Pc/ | <b>X</b> 50      |

L : Nominal life (km) C : Basic dynamic load rating (N)  $P_{c}$ : Calculated load (N) : Hardness factor (see Fig. 10 on **B 1-75**) : Temperature factor

(see Fig.11 on **B1-75**) (see Table2 on **B1-75**)

 $f_{\rm c}$ : Contact factor : Load factor (see Table3 on **B1-76**) fw

## Nominal Life Equation for the Oil-Free LM Guide

$$L = \left(\frac{F_0}{f_w \cdot P_c}\right)^{1.57} \times 50$$

L : Nominal life (km) : Permissible load (N) : Calculated load (N) : Load factor (see Table3 on **1-76**)

Note) The life here means the service of life of the S film based on wear.

Since the service life of the S film may vary according to the environment or the operating conditions, be sure to evaluate and validate the life under the service conditions and operating conditions at the customer.

## **Nominal Life Equation for an LM Guide Using Rollers**

$$L = \left(\frac{f_{\text{H}} \cdot f_{\text{T}} \cdot f_{\text{C}}}{f_{\text{W}}} \cdot \frac{C}{P_{\text{C}}}\right)^{\frac{10}{3}} \times 100$$

f<sub>⊤</sub> : Temperature factor

(see Fig.11 on **B1-75**)

f<sub>c</sub> : Contact factor (see Table2 on **B1-75**) f<sub>w</sub> : Load factor (see Table3 on **B1-76**)

Once the nominal life (L) has been obtained, the service life time can be obtained using the following equation if the stroke length and the number reciprocations are constant.

$$L_h = \frac{L \times 10^6}{2 \times \ell_s \times n_1 \times 60}$$

#### Calculating the Nominal Life

#### [fh: Hardness Factor]

To ensure the achievement of the optimum load capacity of the LM Guide, the raceway hardness must be between 58 and 64 HRC.

If the hardness is lower than this range, the basic dynamic load rating and the basic static load rating decrease. Therefore, it is necessary to multiply each rating by the respective hardness factor (f<sub>tt</sub>).

Since the LM Guide has sufficient hardness, the  $f_{\mbox{\tiny H}}$  value for the LM Guide is normally 1.0 unless otherwise specified.

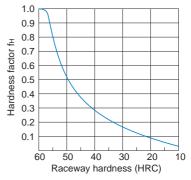

Fig.10 Hardness Factor (fH)

#### [f<sub>T</sub>:Temperature Factor]

If the temperature of the environment surrounding the operating LM Guide exceeds 100°C, take into account the adverse effect of the high temperature and multiply the basic load ratings by the temperature factor indicated in Fig.11. In addition, the selected LM Guide must also be of a high temperature type.

Note) LM guides not designed to withstand high temperatures should be used at 80°C or less.Please contact THK if application requirements exceed 80°C.

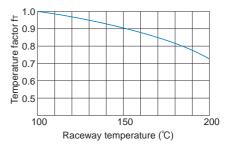

Fig.11 Temperature Factor (f<sub>T</sub>)

#### [fc: Contact Factor]

When multiple LM blocks are used in close contact with each other, it is difficult to achieve uniform load distribution due to moment loads and mounting-surface accuracy. When using multiple blocks in close contact with each other, multiply the basic load rating (C or C<sub>0</sub>) by the corresponding contact factor indicated in Table2.

Note) If uneven load distribution is expected in a large machine, take into account the respective contact factor indicated in Table2.

#### Table2 Contact Factor (fc)

| Number of blocks used in close contact | Contact factor fc |
|----------------------------------------|-------------------|
| 2                                      | 0.81              |
| 3                                      | 0.72              |
| 4                                      | 0.66              |
| 5                                      | 0.61              |
| 6 or greater                           | 0.6               |
| Normal use                             | 1                 |

#### [fw: Load Factor]

In general, reciprocating machines tend to involve vibrations or impact during operation. It is extremely difficult to accurately determine vibrations generated during high-speed operation and impact during frequent start and stop. Therefore, where the effects of speed and vibration are estimated to be significant, divide the basic dynamic load rating (C) by a load factor selected from Table3, which contains empirically obtained data.

Table3 Load Factor (fw)

| Vibrations/<br>impact | Speed (V)                                                             | fw         |  |  |
|-----------------------|-----------------------------------------------------------------------|------------|--|--|
| Faint                 | Very low<br>V≦0.25m/s 1 to 1.2                                        |            |  |  |
| Weak                  | Slow<br>0.25 <v≦1m s<="" td=""><td colspan="2">1.2 to 1.5</td></v≦1m> | 1.2 to 1.5 |  |  |
| Medium                | Medium<br>1 <v≦2m s<="" td=""><td colspan="2">1.5 to 2</td></v≦2m>    | 1.5 to 2   |  |  |
| Strong                | High<br>V>2m/s                                                        | 2 to 3.5   |  |  |

Calculating the Nominal Life

Ptrd<sub>4</sub> = + 
$$\frac{m_1 \cdot \alpha_3 \cdot \ell_3}{2 \cdot \ell_0}$$
 = -111.1 N

#### [Combined Radial And Thrust Load]

#### • During uniform motion:

$$P_{E1} = P_1 = 2891 \text{ N}$$

$$P_{E2} = P_2 = 4459 \text{ N}$$

$$P_{E3} = P_3 = 3479 \text{ N}$$

$$P_{E4} = P_4 = 1911 \text{ N}$$

#### During leftward acceleration

$$P_{E}\ell a_{1} = |P\ell a_{1}| + |Pt\ell a_{1}| = 608.9 \text{ N}$$

$$P_{E}\ell a_{2} = |P\ell a_{2}| + |Pt\ell a_{2}| = 7958.9 \text{ N}$$

$$P_{E}\ell a_{3} = |P\ell a_{3}| + |Pt\ell a_{3}| = 6978.9 \text{ N}$$

$$P_{E}la_{4} = |Pla_{4}| + |Ptla_{4}| = 1588.9 \text{ N}$$

#### During leftward deceleration

$$P_{E}\ell d_{1} = |P\ell d_{1}| + |Pt\ell d_{1}| = 4057.7 \text{ N}$$

$$P_{\scriptscriptstyle E}\ell d_{\scriptscriptstyle 2} = |\; P\ell d_{\scriptscriptstyle 2} \; |\; + \; |\; Pt\ell d_{\scriptscriptstyle 2} \; | = 3514.5 \; N$$

$$P_E \ell d_3 = |P \ell d_3| + |P t \ell d_3| = 2534.5 \text{ N}$$

$$P_{E}\ell d_{4} = |P\ell d_{4}| + |Pt\ell d_{4}| = 3077.7 \text{ N}$$

#### [Static Safety Factor]

As indicated above, the maximum load is applied to the LM Guide during the leftward acceleration of the second LM block. Therefore, the static safety factor  $(f_s)$  is obtained in the following equation.

$$f_{\text{S}} = \ \frac{C_{\text{0}}}{P_{\text{E}} \ell a_{\text{2}}} = \ \frac{81.4 \times 10^{\text{3}}}{7958.9} = 10.2$$

## During rightward acceleration

 $P_{E}ra_{1} = |Pra_{1}| + |Ptra_{1}| = 6390.9 \text{ N}$ 

 $P_E ra_2 = |Pra_2| + |Ptra_2| = 1625.7 N$ 

 $P_{E}ra_{3} = |Pra_{3}| + |Ptra_{3}| = 645.7 N$ 

P<sub>E</sub>ra<sub>4</sub> = | Pra<sub>4</sub> | + | Ptra<sub>4</sub> | = 5410.9 N

#### During rightward deceleration

 $P_E r d_1 = |Pr d_1| + |Pt r d_1| = 1946.5 N$ 

 $P_E rd_2 = |Prd_2| + |Ptrd_2| = 5625.7 N$ 

 $P_E r d_3 = | Pr d_3 | + | Pt r d_3 | = 4645.7 N$  $P_E r d_4 = | Pr d_4 | + | Pt r d_4 | = 966.5 N$ 

Calculating the Nominal Life

#### [Average Load Pmn]

Obtain the average load applied to each LM block.

$$P_{m1} = \sqrt[3]{\frac{1}{2 \cdot \ell_{s}}} \left( P_{E} \ell \, a_{1}^{3} \cdot S_{1} + P_{E1}^{3} \cdot S_{2} + P_{E} \ell \, d_{1}^{3} \cdot S_{3} + P_{E} r a_{1}^{3} \cdot S_{1} + P_{E1}^{3} \cdot S_{2} + P_{E} r d_{1}^{3} \cdot S_{3} \right)$$

$$= \sqrt[3]{\frac{1}{2 \times 1450}} (608.9^{3} \times 12.5 + 2891^{3} \times 1400 + 4057.7^{3} \times 37.5 + 6390.9^{3} \times 12.5 + 2891^{3} \times 1400 + 1946.5^{3} \times 37.5)$$

= 2940.1N

$$\begin{split} P_{m2} &= \sqrt[3]{\frac{1}{2 \cdot \ell_{S}} \ \left(P_{E}\ell \, a_{2}{}^{3} \cdot S_{1} + P_{E2}{}^{3} \cdot S_{2} + P_{E}\ell \, d_{2}{}^{3} \cdot S_{3} + P_{E}ra_{2}{}^{3} \cdot S_{1} + P_{E2}{}^{3} \cdot S_{2} + P_{E}rd_{2}{}^{3} \cdot S_{3}\right)} \\ &= \sqrt[3]{\frac{1}{2 \times 1450} \left(7958.9^{3} \times 12.5 + 4459^{3} \times 1400 + 3514.5^{3} \times 37.5 + 1625.7^{3} \times 12.5 + 4459^{3} \times 1400 + 5625.7^{3} \times 37.5\right)} \end{split}$$

= 4492.2N

$$\begin{split} P_{\text{m3}} &= \sqrt[3]{\frac{1}{2 \cdot \ell_{\text{S}}}} \left( P_{\text{E}} \ell \, a_{\text{3}}^{3} \cdot S_{1} + P_{\text{E3}}^{3} \cdot S_{2} + P_{\text{E}} \ell \, d_{\text{3}}^{3} \cdot S_{3} + P_{\text{E}} \Gamma a_{\text{3}}^{3} \cdot S_{1} + P_{\text{E3}}^{3} \cdot S_{2} + P_{\text{E}} \Gamma d_{\text{3}}^{3} \cdot S_{3} \right) \\ &= \sqrt[3]{\frac{1}{2 \times 1450}} \left( 6978.9^{3} \times 12.5 + 3479^{3} \times 1400 + 2534.5^{3} \times 37.5 + 645.7^{3} \times 12.5 + 3479^{3} \times 1400 + 4645.7^{3} \times 37.5 \right) \end{split}$$

= 3520.4N

$$\begin{split} P_{m4} &= \sqrt[3]{\frac{1}{2 \cdot \ell_{S}}} \; \left( P_{E} \ell \; a_{4}^{3} \cdot S_{1} + P_{E4}^{3} \cdot S_{2} + P_{E} \ell \; d_{4}^{3} \cdot S_{3} + P_{E} r a_{4}^{3} \cdot S_{1} + P_{E4}^{3} \cdot S_{2} + P_{E} r d_{4}^{3} \cdot S_{3} \right) \\ &= \sqrt[3]{\frac{1}{2 \times 1450}} \left( 1588.9^{3} \times 12.5 + 1911^{3} \times 1400 + 3077.7^{3} \times 37.5 + 5410.9^{3} \times 12.5 + 1911^{3} \times 1400 + 966.5^{3} \times 37.5 \right) \end{split}$$

= 1985.5N

#### [Nominal Life L<sub>n</sub>]

The nominal life of the four LM blocks is obtained from the corresponding nominal life equations shown below.

$$\begin{split} L_1 &= \left(\frac{C}{f_W \cdot P_{m1}}\right)^3 \times 50 = 73700 \text{ km} \\ L_2 &= \left(\frac{C}{f_W \cdot P_{m2}}\right)^3 \times 50 = 20600 \text{ km} \\ L_3 &= \left(\frac{C}{f_W \cdot P_{m3}}\right)^3 \times 50 = 43000 \text{ km} \\ L_4 &= \left(\frac{C}{f_W \cdot P_{m4}}\right)^3 \times 50 = 239000 \text{ km} \\ & \text{(where fw = 1.5)} \end{split}$$

Therefore, the service life of the LM Guide used in a machine or equipment under the conditions stated above is equivalent to the nominal life of the second LM block, which is 20.600 km.

## **Example of Calculating the Nominal Life (2) - with Vertical Mount**

[Conditions]

Model No. : HSR25CA2SS+1500L-II

(basic dynamic load rating: C =19.9 kN) (basic static load rating: C₀=34.4 kN)

Mass :  $m_0 = 100 \text{ kg}$  Distance :  $\ell_0 = 300 \text{ mm}$ 

 $\begin{array}{ll} m_1 = \! 200 \; kg & \qquad \ell_1 \! = \! 80 \; mm \\ m_2 = \! 100 \; kg & \qquad \ell_2 \! = \! 50 \; mm \end{array}$ 

Stroke :  $\ell_{\text{S}}$  =1000 mm  $\ell_{\text{s}}$ =280 mm  $\ell_{\text{s}}$ =150 mm

ℓ₅=250 mm

The mass (m<sub>0</sub>) is loaded only during ascent; it is removed during descent.

#### ■Load applied to each LM block in the lateral direction Ptd₁ during descent

$$\begin{array}{lll} Ptd_1 & = & + & \frac{m_1g \cdot \ell_2}{2 \cdot \ell_0} + \frac{m_2g \cdot \ell_2}{2 \cdot \ell_0} = + 245 \; N \\ \\ Ptd_2 & = & - & \frac{m_1g \cdot \ell_2}{2 \cdot \ell_0} - \frac{m_2g \cdot \ell_2}{2 \cdot \ell_0} = -245 \; N \\ \\ Ptd_3 & = & - & \frac{m_1g \cdot \ell_2}{2 \cdot \ell_0} - \frac{m_2g \cdot \ell_2}{2 \cdot \ell_0} = -245 \; N \\ \\ Ptd_4 & = & + & \frac{m_1g \cdot \ell_2}{2 \cdot \ell_0} + \frac{m_2g \cdot \ell_2}{2 \cdot \ell_0} = + 245 \; N \end{array}$$

#### [Combined Radial And Thrust Load]

#### During Ascent

$$\begin{split} &P_{Eu1} = \mid P_{u1} \mid + \mid Pt_{u1} \mid = 1731.3 \text{ N} \\ &P_{Eu2} = \mid P_{u2} \mid + \mid Pt_{u2} \mid = 1731.3 \text{ N} \\ &P_{Eu3} = \mid P_{u3} \mid + \mid Pt_{u3} \mid = 1731.3 \text{ N} \\ &P_{Eu4} = \mid P_{u4} \mid + \mid Pt_{u4} \mid = 1731.3 \text{ N} \end{split}$$

#### During Descent

$$P_{Ed1} = |Pd_1| + |Ptd_1| = 1143.3 \text{ N}$$
 $P_{Ed2} = |Pd_2| + |Ptd_2| = 1143.3 \text{ N}$ 
 $P_{Ed3} = |Pd_3| + |Ptd_3| = 1143.3 \text{ N}$ 
 $P_{Ed4} = |Pd_4| + |Ptd_4| = 1143.3 \text{ N}$ 

#### [Static Safety Factor]

The static safety factor (f<sub>s</sub>) of the LM Guide used in a machine or equipment under the conditions stated above is obtained as follows.

$$f_s = \frac{C_0}{P_{FU2}} = \frac{34.4 \times 10^3}{1731.3} = 19.9$$

#### [Average Load Pmn]

Obtain the average load applied to each LM block.

$$\begin{split} P_{\text{m1}} &= \sqrt[3]{\frac{1}{2 \cdot \ell_{\text{S}}} \left( P_{\text{EU1}}^{3} \cdot \ell_{\text{S}} + P_{\text{Ed1}}^{3} \cdot \ell_{\text{S}} \right) } = 1495.1 \text{ N} \\ P_{\text{m2}} &= \sqrt[3]{\frac{1}{2 \cdot \ell_{\text{S}}} \left( P_{\text{EU2}}^{3} \cdot \ell_{\text{S}} + P_{\text{Ed2}}^{3} \cdot \ell_{\text{S}} \right) } = 1495.1 \text{ N} \\ P_{\text{m3}} &= \sqrt[3]{\frac{1}{2 \cdot \ell_{\text{S}}} \left( P_{\text{EU3}}^{3} \cdot \ell_{\text{S}} + P_{\text{Ed3}}^{3} \cdot \ell_{\text{S}} \right) } = 1495.1 \text{ N} \\ P_{\text{m4}} &= \sqrt[3]{\frac{1}{2 \cdot \ell_{\text{S}}} \left( P_{\text{EU4}}^{3} \cdot \ell_{\text{S}} + P_{\text{Ed4}}^{3} \cdot \ell_{\text{S}} \right) } = 1495.1 \text{ N} \end{split}$$

#### [Nominal Life L<sub>n</sub>]

The nominal life of the four LM blocks is obtained from the corresponding nominal life equations shown below.

$$L_{1} = \left(\frac{C}{f_{W} \cdot P_{m1}}\right)^{3} \times 50 = 68200 \text{ km}$$

$$L_{2} = \left(\frac{C}{f_{W} \cdot P_{m2}}\right)^{3} \times 50 = 68200 \text{ km}$$

$$L_{3} = \left(\frac{C}{f_{W} \cdot P_{m3}}\right)^{3} \times 50 = 68200 \text{ km}$$

$$L_{4} = \left(\frac{C}{f_{W} \cdot P_{m4}}\right)^{3} \times 50 = 68200 \text{ km}$$
(where  $f_{W} = 1.2$ )

Therefore, the service life of the LM Guide used in a machine or equipment under the conditions stated above is 68,200 km.

# **Predicting the Rigidity**

## **Selecting a Radial Clearance (Preload)**

Since the radial clearance of an LM Guide greatly affects the running accuracy, load carrying capacity and rigidity of the LM Guide, it is important to select an appropriate clearance according to the application. In general, selecting a negative clearance (i.e., a preload\* is applied) while taking into account possible vibrations and impact generated from reciprocating motion favorably affects the service life and the accuracy.

For specific radial clearances, contact THK. We will help you select the optimal clearance according to the conditions.

The clearances of all LM Guide models (except model HR, GSR and GSR-R, which are separate types) are adjusted as specified before shipment, and therefore they do not need further preload adjustment.

\*Preload is an internal load applied to the rolling elements (balls, rollers, etc.) of an LM block in advance in order to increase its rigidity.

Table4 Types of Radial Clearance

| Table4 Types of Radial Clearance |                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                 |  |

## Service Life with a Preload Considered

When using an LM Guide under a medium preload (clearance C0), it is necessary to calculate the service life while taking into account the magnitude of the preload.

To identify the appropriate preload for any selected LM Guide model, contact THK.

## Rigidity

When the LM Guide receives a load, its rolling element, LM blocks and LM rails are elastically deformed within a permissible load range. The ratio between the displacement and the load is called rigidity value. (Rigidity values are obtained using the equation shown below.) The LM Guide's rigidity increases according to the magnitude of the preload. Fig.14 shows rigidity difference between normal, C1 and C0 clearances.

The effect of a preload for a 4-way equal load type is translated into the calculated load approx. 2.8 times greater than the magnitude of the preload.

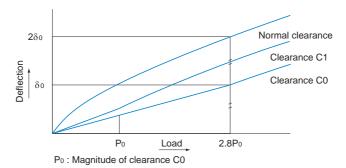

Fig.14 Rigidity Data

$$K = \frac{P}{\delta}$$

Determining the Accuracy

# **Determining the Accuracy**

## **Accuracy Standards**

Accuracy of the LM Guide is specified in terms of running parallelism, dimensional tolerance for height and width, and height and width difference between a pair when 2 or more LM blocks are used on one rail or when 2 or more rails are mounted on the same plane.

For details, see "Accuracy Standard for Each Model" on A1-76 to A1-86.

#### [Running of Parallelism]

It refers to the tolerance for parallelism between the LM block and the LM rail reference surface when the LM block travels the whole length of the LM rail with the LM rail secured on the reference reference surface using bolts.

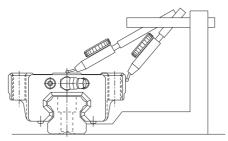

Fig.15 Running of Parallelism

#### [Difference in Height M]

Indicates a difference between the minimum and maximum values of height (M) of each of the LM blocks used on the same plane in combination.

#### [Difference in Width W<sub>2</sub>]

Indicates a difference between the minimum and maximum values of the width  $(W_2)$  between each of the LM blocks, mounted on one LM rail in combination, and the LM rail.

Note1) When 2 or more rails are used on the same plane in parallel, only the width (W<sub>2</sub>) tolerance and the difference on the master rail apply. The master LM rail is imprinted with "KB" (except for normal grade products) following the serial number.

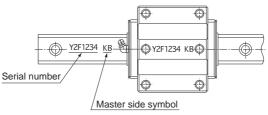

Fig.16 Master LM Rail

Note2) Accuracy measurements each represent the average value of the central point or the central area of the LM block.

Note3) The LM rail is smoothly curved so that the required accuracy is easily achieved by pressing the rail to the reference surface of the machine.

If it is mounted on a less rigid base such as an aluminum base, the curve of the rail will affect the accuracy of the machine. Therefore, it is necessary to define straightness of the rail in advance.

## **Guidelines for Accuracy Grades by Machine Type**

Table5 shows guidelines for selecting an accuracy grade of the LM Guide according to the machine type.

Table5 Guideline for Accuracy Grades by Machine Type

| Type of machine                             |                                        | Accuracy grades |     |        |   |   |    |    |
|---------------------------------------------|----------------------------------------|-----------------|-----|--------|---|---|----|----|
|                                             |                                        | Ct7             | Ct5 | Normal | H | Р | SP | UP |

# **Mounting the LM Guide**

## Marking on the Master LM Guide and Combined Use

#### [Marking on the Master LM Guide]

All LM rails mounted on the same plane are marked with the same serial number. Of those LM rails, the one marked with "KB" after the serial number is the master LM rail. The LM block on the master LM rail has its reference surface finished to a designated accuracy, allowing it to serve as the positioning reference for the table. (See Fig.1.)

LM Guides of normal grade are not marked with "KB." Therefore, any one of the LM rails having the same serial number can be used as the master I M rail.

Master LM Guide

Subsidiary LM Guide

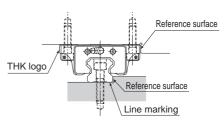

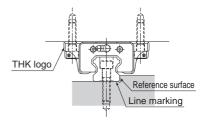

Fig.1 Master LM Guide and Subsidiary LM Guide

#### [Markings on the Reference Surface]

In the LM Guide, the reference surface of the LM block is opposite the surface marked with the THK logo, and that of the LM rail is on the surface marked with a line (see Fig.2). If it is necessary to reverse the reference surface of the LM rail and block, or if the grease nipple must be oriented in the opposite direction, specify it.

Master LM Guide

Subsidiary LM Guide
Fig.2 Markings on the Reference Surface

#### [Serial Number Marking and Combined Use of an LM Rail and LM Blocks]

An LM rail and LM block(s) used in combination must have the same serial number. When removing an LM block from the LM rail and reinstalling the LM block, make sure that they have the same serial number and the numbers are oriented in the same direction. (Fig.3)

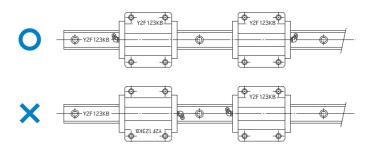

Fig.3 Serial Number Marking and Combined Use of an LM Rail and LM Blocks

#### [Use of Jointed Rails]

When a long LM rail is ordered, two or more rails will be jointed together to the desired length. When jointing rails, make sure that the joint match marks shown in Fig.4 are correctly positioned.

When two LM Guides with connected rails are to be arranged in parallel to each other, the two LM Guides will be manufactured so that the two LM Guides are axisymmetrically aligned.

If a large load is applied near the LM rail joint, the LM rail may deflect and cause misalignment. Therefore, we recommend securely fastening the joint section by pressing the LM rail against the datum plane using a set screw or the like and keeping the L dimension as short as possible (Fig.4). For details, contact THK.

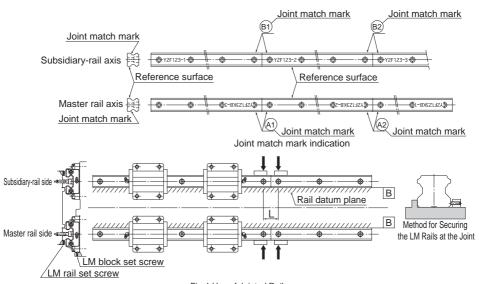

Fig.4 Use of Jointed Rails

#### **Mounting Procedure and Maintenance**

Mounting the LM Guide

## **Mounting Procedure**

[Example of Mounting the LM Guide When an Impact Load is Applied to the Machine and therefore Rigidity and High Accuracy are Required]

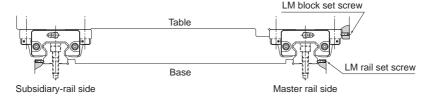

Fig.5 When an Impact Load is Applied to the Machine

#### Mounting the LM Rail(s)

(1) Be sure to remove burr, dent and dust from the mounting surface of the machine to which the LM Guide is to be mounted before installing the LM Guide. (Fig.6)

Note) Since the LM Guide is coated with anti-rust oil, remove it from the reference surface by wiping the surface with washing oil before using the guide. Once the anti-rust oil has been removed, the reference surface is prone to getting rusted. We recommend applying low-viscosity spindle oil.

(2) Gently place the LM rail onto the base, and temporarily secure the bolts to the extent that the LM rail lightly contacts the mounting surface (align the line-marked side of the LM rail with the side reference-surface of the base). (Fig.7)

Note) The bolts for securing the LM Guide must be clean. When placing the bolts into the mounting holes of the LM rail, check if the bolt holes are displaced. (Fig.8) Forcibly tightening the bolt into a displaced hole may deteriorate the accuracy.

Fig.6 Checking the Mounting Surface

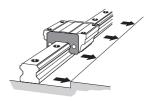

Fig.7 Aligning the LM Rail with the Reference-Surface

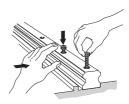

Fig.8 Checking with the Bolt for an Allowance

- (3) Secure the set screws for the LM rail in order with a tightening force just enough to have the rail closely contact the side mounting surface. (Fig.9)
- (4) Tighten the mounting bolts at the designated torque using a torque wrench. (See Fig.10, and Table1 and Table2 on **11-101**.)
  - Note) To achieve stable accuracy when tightening the LM rail mounting bolts, tighten them in order from the center to the rail ends.
- (5) Mount the other rail in the same manner to complete the installation of the LM rails.
- (6) Hammer in caps into the bolt holes on the top face of each LM rail until the top of the cap is on the same level as the top face of the rail.

- Gently place the table on the LM blocks and temporarily fasten the mounting bolts.
- (2) Press the master side LM blocks to the side reference surface of the table using set screws and position the table. (See Fig.5 on 11-91.)
- (3) Fully fasten the mounting bolts on the master side and the subsidiary side to complete the installation.

Note) To evenly secure the table, tighten the mounting bolts in diagonal order as shown in Fig.11.

This method saves time in establishing straightness of the LM rail and eliminates the need to machine securing dowel pins, thus to drastically shorten the installation man-hours.

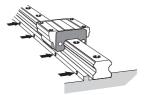

Fig.9 Tightening the Set screws

Fig.10 Fully Fastening the Mounting Bolts

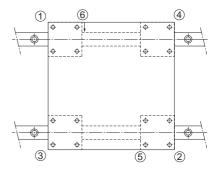

Fig.11 Sequence of Tightening the LM Blocks

#### **Mounting Procedure and Maintenance**

Mounting the LM Guide

#### [Example of Mounting the LM Guide When the Master LM Rail is not Provided with Set screws]

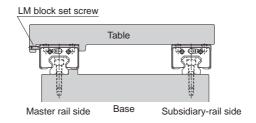

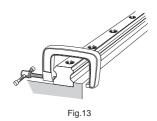

Fig.12 When the Master LM Rail is not Provided with Set screws

#### Mounting the Master LM Rail

After temporarily fastening the mounting bolts, firmly press the LM rail to the side reference surface at the position of each mounting bolt using a small vice and fully fasten the bolt. Perform this in order from either rail end to the other. (Fig.13)

#### Mounting the Subsidiary LM Rail

To mount the subsidiary LM rail in parallel with the master LM rail, which has been correctly installed, we recommend adopting the methods below.

#### ■Using a Straight-edge

Place straight-edges between the two rails, and arrange the straight-edges in parallel with the side reference surface of the master LM rail using a dial gauge. Then, secure the mounting bolts in order while achieving straightness of the subsidiary rail with the straight edge as the reference by using the dial gauge. (Fig.14)

Fig.14

#### **■Using Parallelism of the Table**

Secure the two LM blocks on the master LM rail with the table (or a temporary table for measurement), and temporarily fasten the LM rail and the LM block on the subsidiary LM rail with the table. Place a dial gauge to the side face of the LM block on the subsidiary rail from the dial stand fixed on the table top, then fasten the bolts in order while achieving parallelism of the subsidiary LM rail by moving the table from the rail end. (Fig.15)

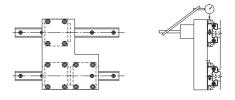

Fig.15

#### ■Having the Subsidiary LM Rail Follow the Master LM Rail

Place the table on the blocks of the correctly mounted master LM rail and the temporarily fastened subsidiary LM rail, and fully fasten the two LM blocks on the master rail and one of the two LM blocks on the subsidiary rail with bolts. Fully tighten the mounting bolts on the subsidiary LM rail in order while temporarily fastening the remaining LM block on the subsidiary LM rail. (Fig.16)

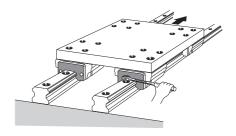

Fig.16

#### **■**Using a Jig

Use a jig like the one shown in Fig.17 to achieve parallelism of the reference surface on the subsidiary side against the side reference surface of the master side from one end of the rail by the mounting pitch, and at the same time, fully fasten the mounting bolts in order. (Fig.17)

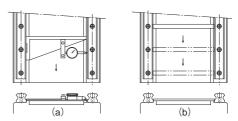

Fig.17

#### **Mounting Procedure and Maintenance**

Mounting the LM Guide

# [Example of Mounting the LM Guide When the Master LM Rail Does not Have a Reference Surface]

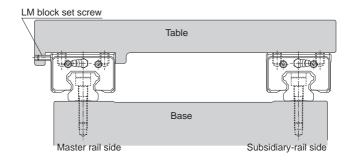

Fig.18

## Mounting the Master LM Rail

#### ■Using a Temporary Reference Surface

You can temporarily set a reference surface near the LM rail mounting position on the base to achieve straightness of the LM rail from the rail end. In this method, two LM blocks must be joined together and attached to a measurement plate, as shown in Fig.19.

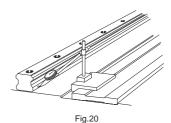

Fig.19

#### ■Using a Straight-edge

After temporarily fastening the mounting bolts, use a dial gauge to check the straightness of the side reference surface of the LM rail from the rail end, and at the same time, fully fasten the mounting bolts.(Fig.20)

To mount the subsidiary LM rail, follow the procedure described on **B1-93**.

#### [Procedure for Assembling Model HR]

The following procedure is recommended for assembling model HR.

- Remove burr or knots from the LM rail mounting surface of the base using an oilstone. (Fig.21)
- (2) Use a small vice to press the two LM rails to the base so that they closely contact the reference surface, then tighten the mounting bolts to the recommended torque (see B1-101). (Fig.22)
  - a. Check if any of the bolts has a sinking.
  - b. Use a torque wrench to tighten the bolts in order from the center to both ends.
- (3) Mount the LM blocks on the table, then install them onto the LM rails. Be sure the mounting bolts for the LM blocks are temporarily fastened.
- (4) Tighten the clearance adjustment bolt alternately to adjust the clearance.
  - If a relatively large preload is applied in order to achieve high rigidity, control the tightening torque or the rolling resistance.
  - a. It is preferable to use three clearance adjustment bolts for each LM block as shown in Fig.23.
  - b. To obtain a favorable result of the clearance adjustment, set the tightening torque of the two outside screws at approx. 90% of that of the enter screw.
- (5) Secure each LM block by gradually tightening the two LM block mounting bolts, which have temporarily been fastened, while sliding the table. (Fig.24)

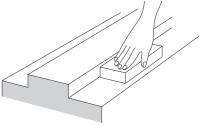

Fig.21

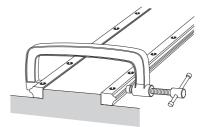

Fig.22

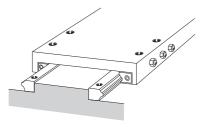

Fig.23

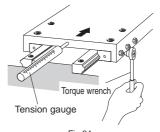

Fig.24

## **Mounting Procedure and Maintenance**

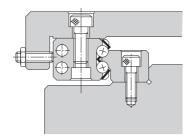

Mounting the LM Guide

#### • Example of Clearance Adjustment

Design the clearance adjustment bolt so that it presses the center of the side face of the LM block.

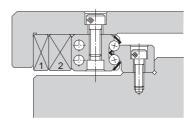

a. Using an adjustment screw

Normally, an adjustment screw is used to press the LM block.

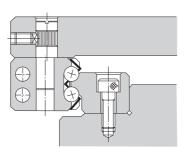

#### b. Using tapered gibs

When high accuracy and high rigidity are required, use tapered gibs 1) and 2).

#### c. Using an eccentric pin

A type using an eccentric pin to adjust the clearance is also available.

#### [Procedure for Assembling Model GSR]

The procedure for assembling model GSR is as follows:

- Align the table with the reference-surface of each LM block and fully fasten the mounting bolts to secure the blocks.
  - Both ends of the table must have a datum surface. (Fig.25)
- (2) Place LM rail A onto the base and align the rail with a straight-edge.
  - Fully fasten the mounting bolts using a torque wrench. (Fig.26)
- (3) Temporarily secure LM rail B onto the base, then mount the blocks on the rail by sliding the blocks.
  - Temporarily fasten LM rail B while pressing it toward the LM blocks. (Fig.27)
- (4) Slide the table a few strokes to fit the LM blocks to LM rail B, then fully fasten LM rail B using a torque wrench. (Fig.28)

If there are more GSR units to be assembled, we recommend producing a jig like the one shown in Fig.29 first. You can easily mount LM rails while achieving parallelism of the LM rails using the jig.

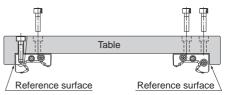

Fig.25

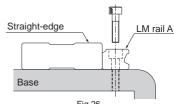

Fig.26

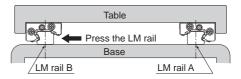

Fig.27

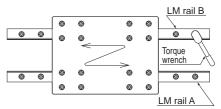

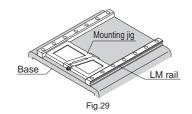

Fig.28

#### **Mounting Procedure and Maintenance**

Mounting the LM Guide

#### [Procedure for Assembling Model JR]

#### Mounting the LM Rails

When two LM rails are to be used in parallel as shown in Fig.30, first secure one LM rail on the base, and place a dial gauge on the LM block. Then, place the pointer of the dial gauge on the side face and top face of the other LM rail to simultaneously adjust the parallelism and the level, thus to complete mounting the LM rails.

#### Jointing LM Rails

When two or more LM rails are to be jointed, a special metal fitting as shown in Fig.31 is available. For such applications, specify this fitting when ordering the LM Guide (the rail will be tapped for attaching a joint fitting).

#### Installation Procedure

- (1) Temporarily fasten the rail presser bolt.
- (2) Secure rail A and the joint fitting with bolts C and D.
- (3) Apply a dial gauge to side G of the joint between rails A and B. Adjust the left and right level differences using bolt E and set screw F on rail B.
  - If bolt E is tightened, rail B will move toward b side.
  - If set screw F is tightened, rail B will move toward a side.
- (4) When the adjustment using set screw F is finished, secure set screw F with the nut.
- (5) Adjust and secure the vertical direction using the rail presser.

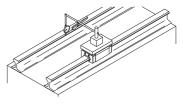

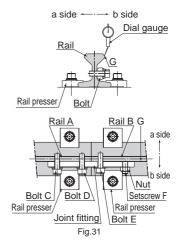

Fig.30

#### Welding the LM Rail

When welding the LM rail, it is best to weld the LM rail while clamping it at the welding point with a small vice or the like as shown in Fig.32. For effective welding, we recommend the following welding conditions. (During welding the LM rail, take care to prevent spatter from contacting the LM rail raceway.)

[Welding conditions]
Preheating temperature:200°C
Postheating temperature:350°C

Note) If the temperature exceeds 750°C, the LM rail may be hardened again.

[For shielded metal arc welding] Welding rod: LB-52 (Kobelco)

[For carbon dioxide arc welding]

Wire: YGW12 Electric current: 200A

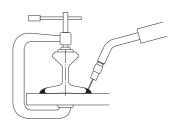

Fig.32

#### [Procedure for Assembling Model HCR]

To install the LM rails of R Guide model HCR, we recommend having any form of datum point (such as a pin) on the reference side (inside) of the LM rail, and pressing the LM rail to the datum point then stopping the LM rail with a presser plate from the counter-reference surface.

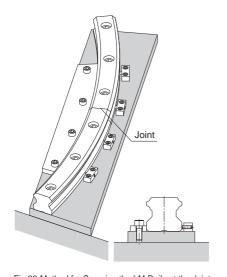

Fig.33 Method for Securing the LM Rails at the Joint

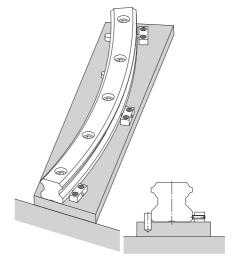

Fig.34 Method for Securing the LM Rail Using a Pin as a Datum Point

#### **Mounting Procedure and Maintenance**

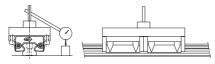

Mounting the LM Guide

## **Methods for Measuring Accuracy after Installation**

#### [When Measuring Running Accuracy for Single Rail Application]

When measuring running accuracy of the LM block, stable accuracy can be obtained by securing two LM blocks on an inspection plate, as shown in Fig.35. When using a dial gauge, we recommend placing the straight-edge as close as possible to the LM block in order to perform accurate measurement.

- 1) Measurement method using an auto-collimator
- 2) Measurement method using a dial gauge

Fig.35 Methods for Measuring Accuracy after Installation

## **Recommended Tightening Torque for LM Rails**

With high-precision LM rails for the LM Guide, their raceways are ground and accuracy is inspected with the rails tightened with bolts. When mounting a high-precision LM rail on a machine, we recommend using the corresponding tightening torque indicated in Table1 or Table2

Table1 Tightening Torques when Pan Head Screws are Used Unit: N-cm

| Screw     | Tightenir    | ng torque |  |
|-----------|--------------|-----------|--|
| model No. | Not hardened | Hardened  |  |
| M 2       | 17.6         | 21.6      |  |
| M 2.3     | 29.4         | 35.3      |  |
| M 2.6     | 44.1         | 52.9      |  |

Table 2 Tightening Torques when Hexagonal-Socket-Head Type Bolts are Used Unit: N-cm

| Screw     | Tightening torque |           |          |

Laminated Contact Scraper LaCS

# Laminated Contact Scraper LaCS

- ●For the supported models, see the table of options by model number on △1-474.
- ●For the LM block dimension (dimension L) with LaCS attached, see △1-484 to △1-491.
- ●For the resistance of LaCS, see ▲1-500.

For locations with adverse environment, Laminated Contact Scraper LaCS is available. LaCS removes minute foreign material adhering to the LM rail in multiple stages and prevents it from entering the LM block with laminated contact structure (3-layer scraper).

### [Features]

- Since the 3 layers of scrapers fully contact the LM rail, LaCS is highly capable of removing minute foreign material.
- Since it uses oil-impregnated, foam synthetic rubber with a self-lubricating function, low friction resistance is achieved.

| Symbol | Contamination Protection Accessories                                                          |
|--------|-----------------------------------------------------------------------------------------------|
| SSHH   | With end seal + side seal + inner seal + LaCS                                                 |

Large amount of foreign matter has entered the raceway

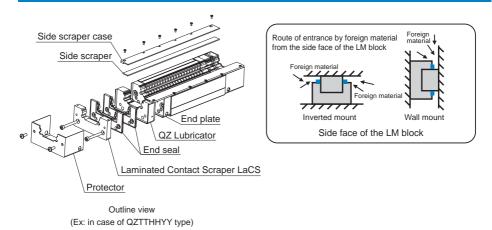

No foreign matter entering the raceway observed

Side scraper

# Side scraper

- For the supported models: models SVR/SVS
- ●For the resistance of side scraper, see ▲1-501.
- For the LM block dimension (dimension L) with side scraper attached, see △1-484.

### [Features]

- Minimizes foreign material entering from the side of the LM Guide in a harsh environment.
- Demonstrates a dust protection effect in inverted or wall mount.

Model number coding

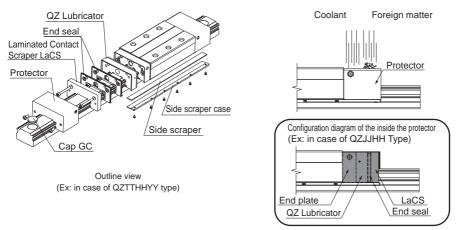

SVR45 LR 1 QZ JJHH YY C1 +1200L

With side scraper\*

<sup>\*</sup> The side scraper can accommodate various options of dust control accessories and lubrication accessories. For details, contact THK.

## **Protector**

- For the supported models: models SVR/SVS
- OHH type (with LaCS) of models SVR/SVS is provided with the protector.
- ●For the LM block dimension (dimension L) with protector attached, see △1-484.

## [Features]

 The protector minimizes the entrance of foreign material even in harsh environments where foreign material such as fine particles and liquids are present.

Note) Contact THK if you want to use the protector with other options.

# **Light-Resistance Contact Seal LiCS**

- ●For the supported models, see the table of options by model number on △1-474.
- For the LM block dimension (dimension L) with LiCS attached, see △1-495.
- ●For the resistance of LiCS, see ▲1-501.

LiCS is a light sliding resistance contact seal. It is effective in removing dust on the raceway and retaining a lubricant such as grease. It achieves extremely low drag and smooth, stable motion.

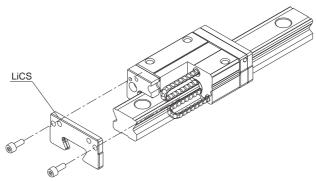

Fig.1 Structural Drawing of SSR + LiCS

#### [Features]

Light-Resistance Contact Seal LiCS is a seal that uses a light-resistance material in its sealing element and contacts the LM rail raceway to achieve low drag resistance. It is optimal for applications where low drag resistance is required, such as semiconductor-related devices, inspection devices and OA equipment all of which are used in favorable environments.

- Since the sealing element contacts the LM rail raceway, it is effective in removing dust on the raceway.
- Use of oil-impregnated, expanded synthetic rubber, which has excellent self-lubricating property, achieves low drag resistance.

Cap C

# Cap C

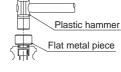

If any of the LM rail mounting holes of an LM Guide is filled with cutting chips or foreign material, they may enter the LM block structure. Entrance of such foreign material can be prevented by covering each LM rail mounting hole with the dedicated cap.

Since the dedicated cap C for LM rail mounting holes uses a special synthetic resin with high oil resistance and high wear resistance, it is highly durable.

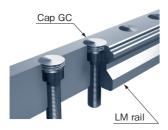

To attach the dedicated cap to the mounting hole, place a flat metal piece like one shown in Fig.1 on the cap and gradually hammer in the cap until it is on the same level as the top face of the LM rail. When attaching the dedicated cap C for LM rail mounting holes, do not remove any of the LM blocks from the LM rail.

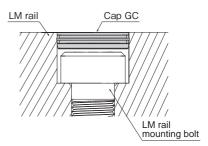

# Cap GC

GC caps are metal caps designed to cover the mounting holes in LM rails (in compliance with RoHS directives).

In harsh environments, preventing any influx of coolant or foreign material from the top face of the LM rail, coupled with the use of seals, will dramatically improve the contamination protection performance for the LM guide.

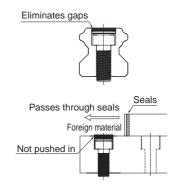

## [Features]

 Eliminating gaps around the mounting holes (countersunk holes)

The GC caps press into the mounting holes (countersunk holes) so that there are no gaps.

 Provides long-term sealing due to its excellent abrasion resistance

If a countermeasure such as a seal passes along the rail when there is foreign matter on the upper surface of the LM rail, it generates force pushing the GC cap in from above. In this situation, the cap does not get pushed inwards as it is easily strong enough to stay in place.

• GC caps are highly effective in a range of different environments.

| Coming anvironment |                                                                               | LM G                                                       | uide                  | Example of Using               |                                |

Cap GC

## [Applicable model number]

C0 +1200L TTHH GC

LM rail length (in mm)

Model No. Type of LM block With QZ Lubricator

Radial clearance symbol Normal (No symbol) Contamination Light preload (C1) protection accessory Medium preload (C0) symbol

With GC cap Symbol for No. of rails used on the same plane

Accuracy symbol Normal grade (No Symbol)/High accuracy grade (H) Precision grade (P)/Super precision grade (SP)
Ultra precision grade (UP)

No. of LM blocks

used on the same rail

Note1) LM guides with GC caps are special rails. Note2) They cannot be mounted on stainless steel LM rails or LM rails that have undergone surface treatment.

Note3) If this product will be used in special environments, such as in a vacuum or at very low or high temperatures, contact

Note4) GC caps are not sold individually. They are sold as a set with LM guides.

Note5) The openings of LM rail mounting holes are not chamfered. Take care not to injure your hands while working.

Note6) After fitting GC caps, the upper surface of the LM rail must be flattened and cleaned (wiped).

Note7) If you wish to fit GC caps for a single rail, use the sample model number configuration shown below.

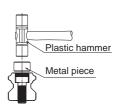

(Example) SVR45LR2QZTTHHC0+1200LPGC

With GC cap

\* Add the symbol (GC) to the end of the model number.

## Mounting method

The procedure for inserting a GC cap into a mounting hole consists of using a flat aligning fitting to gradually punch the cap into the hole until it is level with the upper surface of the LM rail, as shown in the figure. Fit GC caps without removing the LM rail from the LM block.

# Plate Cover SV Steel Tape SP

●For the supported models, see the table of options by model number on 🖾 1-474.

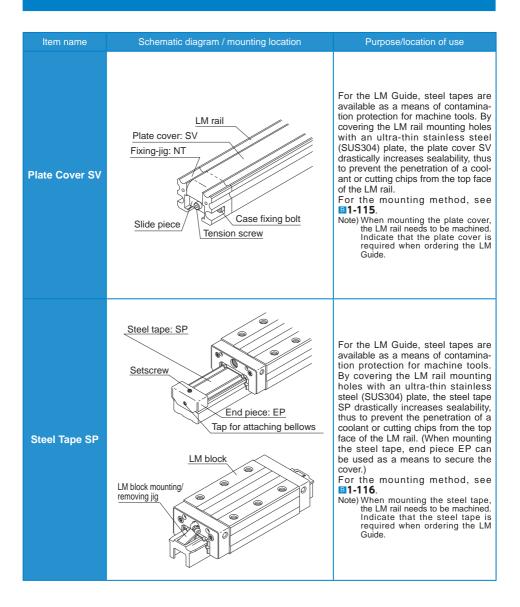

Plate Cover SV Steel Tape SP

## [Mounting Procedure for Plate Cover SV]

- (1) Attach slide pieces to the plate cover.
  - Place the slide pieces on the plate cover with their chamfered sides facing outward, hold the plate cover with the slide pieces and the securing plates, and then secure them with countersunk screws.
- (2) Use an LM block mounting/removing jig to remove the LM block from the LM rail, and then mount the fixing-jigs onto the LM rail. Identify the positions of the mounting holes on the fixing jigs, then secure the jigs with hexagonal-socket-head type bolts.
- (3) Temporarily secure either slide piece. Insert either slide piece into one of the fixing-jigs, then attach the slide piece to the LM rail's end face using the tension adjustment bolt and gently secure the bolt until the bolt head is inside the fixing-jig.
- (4) Temporarily secure the other slide piece. Temporarily secure the other slide piece in the same manner as above.
- (5) Apply tension to the plate cover. Apply tension to the plate cover by evenly securing the tension adjustment bolts on both ends of the LM rail. Make sure there is only a small difference between the H and H' dimensions in Fig.5. If the difference is too large, there may be no interference left on either
- (6) Mount the LM block on the LM rail. Identity the reference surface of the LM rail and the LM block, then insert the LM rail into the LM block using the LM block mounting / removing jig.

end.

Note1) When removing or the mounting the LM block, use much care not to let the balls fall off.

Note2) The plate cover is an ultra-thin stainless steel (SUS304) plate. When handing it, use much care not to bend it.

Note3) The plate cover is available for models NR/NRS35 to 100.

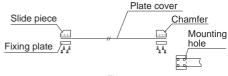

Fig.1

Fig.2

Fig.3

Fig.4

Fig.5

## [Mounting Procedure for Steel Tape SP]

- Use an LM block mounting/removing jig to remove the LM block from the LM rail.
- (2) Thoroughly degrease and clean the top face of the LM rail, to which the steel tape is to be adhered. For degreasing, use an adequately volatile detergent (e.g., industrial alcohol).
- (3) Carefully adhere the steel tape from the end with care not to let it bend or sag, while gradually peeling the release paper from the steel tape.
- (4) Have the steel tape settle on the rail by rubbing the tape. The adhesive strength increases with time. The adhering tape can be peeled off by pulling its end upward.
- (5) Mount the LM block onto the LM rail using the LM block mounting/removing jig.
- (6) Attach the end pieces on both ends of the LM rail and further secure the steel tape. When securing the end pieces, fasten only the setscrew on the top face of each end piece.

(The tap on the end face of the end piece is used for mounting bellows.)

Note1) The setscrew on the side face is used to lightly secure the bent steel tape. Be sure to stop fastening the screw as soon as it hits the end face, and do not force the screw further.

Note2) Since the steel tape is a thin steel plate, mishandling it may cause an accident such as cutting your finger. When handling it, take an effective safety measure such as wearing rubber gloves.

**QZ** Lubricator

## **QZ** Lubricator

- ●For the supported models, see the table of options by model number on 🖾 1-474.
- ●For the LM block dimension with QZ attached, see 🖾 1-505 to 🖾 1-508.

QZ Lubricator feeds the right amount of lubricant to the raceway on the LM rail. This allows an oil film to continuously be formed between the rolling element and the raceway, and drastically extends the lubrication and maintenance intervals.

The structure of QZ Lubricator consists of three major components: (1) a heavy oil-impregnated fiber net (function to store lubricant), (2) a high-density fiber net (function to apply lubricant to the raceway) and (3) an oil-control plate (function to adjust oil flow). The lubricant contained in QZ Lubricator is fed by the capillary phenomenon, which is used also in felt pens and many other products, as the fundamental principle.

### [Features]

- Since it supplements an oil loss, the lubrication maintenance interval can be significantly extended.
- Eco-friendly lubrication system that does not contaminate the surrounding area since it feeds the right amount of lubricant to the ball raceway.

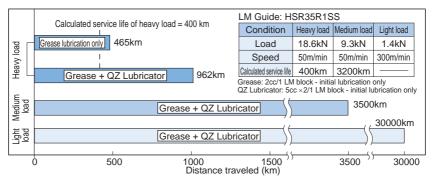

| Symbol  | Contamination Protection Accessories                                                               |
|---------|----------------------------------------------------------------------------------------------------|
| QZUU    | With end seal + QZ                                                                                 |
| QZSS    | With end seal + side seal + inner seal + QZ                                                        |

| QZGG    | With LiCS + QZ                                                                                     |
| QZPP    | With LiCS + side seal + inner seal + QZ                                                            |
| QZSSHH  | With end seal + side seal + inner seal + LaCS + QZ                                                 |
| QZDDHH  | With double seals + side seal + inner seal + LaCS + QZ                                             |
| QZZZHH  | With end seal + side seal + inner seal + metal scraper + LaCS + QZ                                 |
| QZKKHH  | With double seals + side seal + inner seal + metal scraper + LaCS + QZ                             |
| QZJJHH* | With end seal + side seal + inner seal + LaCS + QZ + protector (serving also as metal scraper)     |
| QZTTHH* | With double seals + side seal + inner seal + LaCS + QZ + protector (serving also as metal scraper) |

<sup>\*</sup> QZJJHH and QZTTHH are available only for models SVR/SVS.

Note) HH type (with LaCS) of models SVR/SVS is provided with the protector (see 11-108). Contact THK if you want to use the Protector with other options.

## Significantly Extended Maintenance Interval

Attaching QZ Lubricator helps extend the maintenance interval throughout the whole load range from the light load area to the heavy load area.

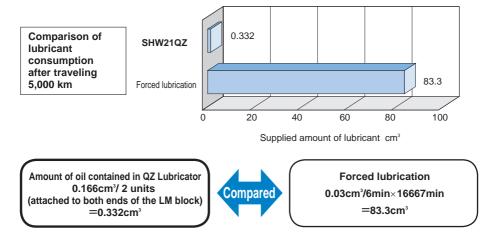

LM Guide Running Test without Replenishment of Lubricant

#### Effective Use of Lubricant

Since the lubricator feeds the right amount of lubricant to the ball raceway, lubricant can be used efficiently.

[Test conditions] speed: 300 m/min

Lubricant consumption is 1/250 less than forced lubrication.

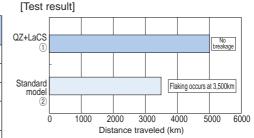

**QZ** Lubricator

## • Effective in Helping Lubrication under Severe Environments

A 5,000 km durability test was conducted under severe environments (containing coolant and contaminated environment).

[Test conditions]

| Model No.           | ① Caged Ball LM<br>Guide #45  | ② Full-ball LM<br>Guide #45                                                  |  |  |  |
|---------------------|-------------------------------|------------------------------------------------------------------------------|--|--|--|
| Load                | 8kN                           | 6kN                                                                          |  |  |  |
| Speed               | 60m                           | /min                                                                         |  |  |  |
| Coolant             | Immersed 48 hrs, dried 96 hrs |                                                                              |  |  |  |
| Foreign<br>material | Foundry dust (125 µm or less) |                                                                              |  |  |  |
| Lubrication         | AFA Grease + QZ               | Super Multi 68 Oiling cycle: 0.1cc/shot Periodically lubricated every 16 min |  |  |  |

<sup>\*</sup> When using the LM system under severe environment, use QZ Lubricator and Laminated Contact Scraper LaCS (see "Laminated Contact Scraper LaCS" on **11-105**) in combination.

# **Lubrication Adapter**

An oil lubricant-only lubrication adapter is available for models NR/NRS.

Even if the LM Guide is installed in an orientation where oil lubrication is difficult, such as wall mount and inversed mount, the adapter is capable of feeding a constant quantity of lubricant to the four raceways.

## [Features]

The dedicated lubrication adapter for models NR-NRS is built in with a constant quantity distributor. Therefore, the adapter can accurately feed a constant quantity of lubricant to each raceway regardless of the mounting orientation. The adapter is economical since it is capable of constantly feeding the optimum amount of lubricant and helping eliminate the supply of surplus lubricant.

To provide pipe arrangement, simply connect an intermittent lubrication pump widely used for ordinary machine tools to the greasing holes (M8) on the front and the side of the lubrication adapter.

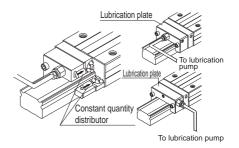

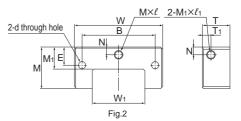

Fig.1 Structural Drawing

### [Specifications]

| Viscosity range of lubricant used | 32 to 64 mm²/s recommended |  |  |  |
|-----------------------------------|----------------------------|--|--|--|
| Discharge                         | 0.03×4, 0.06×4cc/1shot     |  |  |  |
| Diameter of pipe connected        | φ4, φ6                     |  |  |  |
| Material                          | Aluminum alloy             |  |  |  |

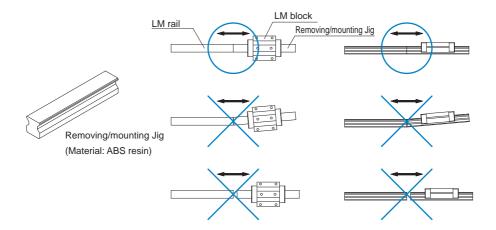

Removing/mounting Jig

# **Removing/mounting Jig**

When assembling the guide, do not remove the LM block from the LM rail whenever possible. If it is inevitable to remove the LM block due to the plate cover type or the assembly procedure, be sure to use the removing/mounting jig.

Mounting the LM block without using the removing/mounting jig may cause rolling elements to fall from the LM block due to contamination by foreign material, damage to internal components or slight inclination. Mounting the LM block with some of the rolling elements missing may also cause damage to the LM block at an early stage.

When using the removing/mounting jig, do not incline the jig and match the ends of both LM rails. If any of the rolling elements falls from the LM block, contact THK instead of using the product. Note that the removing/mounting jig is not included in the LM Guide package as standard. When desiring to use it, contact THK.

## **End Piece EP**

For those models whose balls may fall if the LM rail is pulled out of the LM block, an end piece is attached to the product to prevent the LM block from being removed from the LM rail.

For models that can use the end piece, see the table below.

If removing the end piece when using the LM Guide, be sure that the LM block will not overshoot. The end piece can also be used as a fixing jig for a steel tape, and is available also for the LM rail of models SSR, SR and HSR.

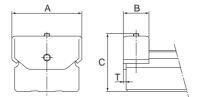

Fig.1 End Piece EP for Models NR/NRS

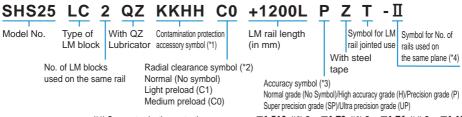

Model No. LM Guide

## **Model Number Coding**

Model number configurations differ depending on the model features. Refer to the corresponding sample model number configuration.

### [LM Guide]

Models SHS, SSR, SVR/SVS, SHW, HSR, SR, NR/NRS, HRW, JR, NSR-TBC, HSR-M1, SR-M1 and HSR-M2.

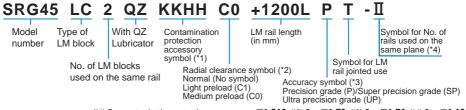

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-70. (\*3) See A1-76. (\*4) See A1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

## [Caged Roller LM Guide]

Models SRG, SRN and SRW

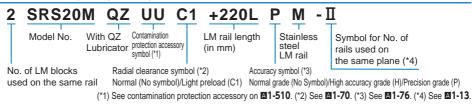

(\*1) See contamination protection accessory on △1-510. (\*2) See △1-70. (\*3) See △1-76. (\*4) See △1-13.

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

Those models equipped with QZ Lubricator cannot have a grease nipple.

### [Miniature Type LM Guide]

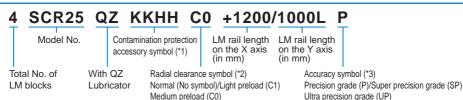

Models SRS, RSR, RSR-Z, and RSR-M1

Note) This model number indicates that a single-rail unit constitutes one set. (i.e., required number of sets when 2 rails are used in parallel is 2 at a minimum.)

## [Cross LM Guide]

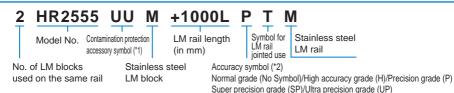

Models SCR, CSR and MX

(\*1) See contamination protection accessory on \$\textbf{1}-510\$. (\*2) See \$\textbf{1}-70\$. (\*3) See \$\textbf{1}-76\$.

## [Separate LM Guides]

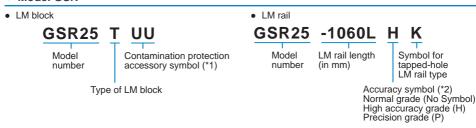

Model HR

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-76.

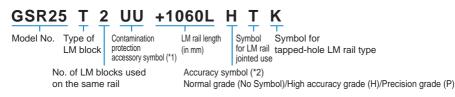

Note) One set of model HR means a combination of two LM rails and an LM blocks used on the same plane.

#### Model GSR

(\*1) See contamination protection accessory on ■1-510. (\*2) See ■1-76.

· Combination of LM rail and LM block

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-76.

Note) One set of model GSR: This model number indicates that a single-rail unit constitutes one set.

#### Model No.

## [R Guide]

## Model HCR

No. of LM blocks Radial clearance symbol (\*2) Accuracy symbol (\*3) used on one axis (\*4) used on the same rail Normal (No symbol)/Light preload (C1) Normal grade (No Symbol)/High accuracy grade (H)

(\*1) See A1-510 (contamination protection accessories). (\*2) See A1-70. (\*3) See A1-76.

(\*4) Number of LM rails used on one arc. For details, contact THK.

(\*1) See contamination protection accessory on A1-510. (\*2) See A1-13.

Note) This model number denotes one set consists of an LM block and LM rail. (i.e. If you are using 2 shafts, the required number of sets is 2.)

Model HMG does not have a seal as standard.

#### [LM Guide for Medium-to-Low Vacuum]

Model HSR-M1VV

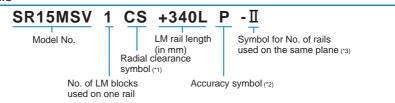

(\*1) See A1-70 (\*2) See A1-397 (\*3) See A1-76 (\*4) See A1-13.

Note1) The radial clearance, maximum LM rail length and accuracy class are equal to that of model HSR.

Note2) With this model, a single-rail unit constitutes one set (i.e., the required number of sets when 2 rails are used in parallel is 2).

## [Oil-Free LM Guide for Special Environments]

#### Model SR-MS

(\*1) See A1-70. (\*2) See A1-76. (\*3) See A1-13.

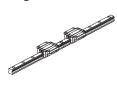

Note) With this model, a single-rail unit constitutes one set (i.e., the required number of sets when 2 rails are used in parallel is 2)

## **Notes on Ordering**

#### [Order units]

Note that the number of items that constitute one set differs depending on the type of LM guide. Check the sample model number configurations and the accompanying notes.

## Sample LM guide orders

SHS25C2SSC1+640L 1 set

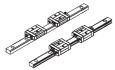

SHS25C2SSC1+640L- II 2 sets

## Sample model HR orders

HR2555UU+600L1 set

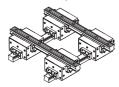

## Sample model GSR and GSR-R orders

GSR25T2UU+1060L 2 sets

#### Model No.

## Sample cross LM guide orders (SCR, CSR and MX)

4SCR25UU+1200/1000LP 1 set

## Sample model HMG orders

HMG15A 2 UU C1 +1000LT + 60/150R 6T + 60/300R 6T - II 2 sets
Note) When ordering model HMG, attach a reference diagram clearly showing the positioning of the LM block and LM rail.

### [Mounted orientation and lubrication method]

When placing an order, be sure to let THK know the mounting orientation and the exact position in each LM block where the grease nipple or the piping joint should be attached.

For the mounting orientation and the lubrication, see **B1-28** and **B24-2**, respectively.

## [Supported options]

The supported options differ depending on the model number. Check the available options when ordering.

See A1-474.

## [Maximum manufactured lengths for LM rails]

Where a high degree of precision is required, limits apply to the maximum manufactured lengths for LM rails. In such situations, contact THK.

## **Precautions on Using the LM Guide**

## [Handling]

- (1) This product consists mostly of heavy items (20 kg or more). When moving heavy items, use 2 or more people or moving equipment. This could cause injury or product damage.
- (2) Do not disassemble the parts. This will cause dust to enter the product resulting in loss of functionality.
- (3) Tilting an LM block or LM rail may cause them to fall by their own weight.
- (4) Take care not to drop or strike the LM guide. Failure to do so could cause injury or product damage. Giving an impact to it could also cause damage to its function even if the product looks intact.
- (5) Prevent foreign material, such as dust or cutting chips, from entering the system. This could cause damage to ball circulation components and loss of functionality.
- (6) When planning to use the LM system in an environment where the coolant penetrates the LM block, it may cause trouble to product functions depending on the type of the coolant. Contact THK for details.
- (7) Do not use the product at temperature of 80°C or higher. Contact THK if you desire to use the product at a temperature of 80°C or higher.
- (8) If foreign material such as dust or cutting chips adheres to the product, replenish the lubricant after cleaning the product with pure white kerosene. For available types of detergent, contact THK.
- (9) If an LM guide will be in an inverted orientation, take preventive measures such as adding a safety mechanism to prevent falls. If the end plate is damaged due to an accident, etc., balls may fall out of the guide or the LM block become detached from the LM rail and fall down.
- (10)When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.
- (11)When removing the LM block from the LM rail and then replacing the block, an LM block mounting/removing jig that facilitates such installation is available. Contact THK for details.

#### [Lubrication]

- (1) Thoroughly remove anti-rust oil and feed lubricant before using the product.
- (2) Do not mix lubricants of different physical properties.
- (3) In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- (4) When planning to use a special lubricant, contact THK before using it.
- (5) When adopting oil lubrication, the lubricant may not be distributed throughout the LM system depending on the mounting orientation of the system. Contact THK for details.
- (6) Although lubrication should be performed approximately every 100 km in travel distance, the lubrication interval may vary substantially according to conditions and the service environment. Contact THK for details.
- (7) If the mounting orientation is other than horizontal use, the lubricant may not reach the raceway completely.
  - For the mounting orientation and the lubrication, see **1-28** and **24-2**, respectively.

#### [Storage]

When storing the LM Guide, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding high temperature, low temperature and high humidity.

#### Precautions on Use

Precautions on Handling the LM Guide for Special Environment

# Precautions on Handling the LM Guide for Special Environment

## [Handling]

For the handling of LM Guides for special environment such as the LM Guide for Medium-to-Low Vacuum and the Oil-Free LM Guide, see the features of the respective model (LM Guide for Medium-to-Low Vacuum: A1-396 onward; Oil-Free LM Guide: A1-404 onward).

# **Precautions on Using Options for the LM Guide**

## QZ Lubricator for the LM Guide

### [Precaution on Selection]

Secure a stroke longer than the overall LM block with QZ Lubricator attached.

### [Handling]

Take care not to drop or strike this product. This could cause injury or product damage.

Do not block the vent hole with grease or the like.

QZ is a lubricating device designed to feed a minimum amount of oil to the raceway, and does not provide an anti-rust effect to the whole LM Guide. When using it in an environment subject to a coolant or the like, we strongly recommend applying grease to the mounting base of the LM Guide and to the rail ends as an anti-rust measure.

## [Service environment]

Be sure the service temperature of this product is between -10 to +50°C, and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked. When using it out of the service temperature range, contact THK in advance.

When desiring to use the product in a special environment, contact THK.

## Laminated Contact Scraper LaCS, Side Scraper for LM Guides

#### [Handling]

The lubricant impregnated into the scraper is used to increase its sliding capability. For lubrication of the LM Guide, attach QZ Lubricator, or the grease nipple on the side face of the end plate of the LM block, before providing a lubricant.

When using the product, be sure to attach the rail cap C or the plate cover.

### [Service environment]

Be sure the service temperature of this product is between -20 to +80°C, and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked.

#### [Notes on the Product Functions]

It is specifically designed to provide dust prevention capability to remove foreign material and liquid. To seal oil, an end seal is required.

## **Light Contact Seal LiCS for LM Guides**

## [Handling]

The lubricant impregnated into LiCS is used to increase its sliding capability. For lubrication of the LM Guide, attach the grease nipple on the end plate of the LM block before providing a lubricant.

## [Service environment]

Be sure the service temperature of this product is between -20 to +80°C, and do not clean the product by immersing it in an organic solvent or white kerosene, or leave it unpacked. It contacts only with the LM rail raceway. Do not use it in harsh environments.

## Cap GC

## [Handling]

If GC caps are specified for the product, the edges of the LM rail mounting hole openings will be sharp. Take great care not to injure your fingers or hands while working.

When fitting GC caps, use a flat aligning tool to gradually punch the cap into the hole until it is level with the upper surface of the LM rail. Then run an oil stone over the rail until the upper surface of the rail and the GC caps are completely flat.
